Case

A 52-year-old woman presented in September 2014 to an Ebola treatment unit operated by the International Medical Corps in Liberia, reporting a 5-day history of fever and muscle and joint pain. She also reported the development of headache, anorexia, nausea, mild diarrhea, and mild chest pains in the preceding 1 to 2 days. She noted no mucosal or gastrointestinal bleeding, abdominal pain. rash . . .

About Interactive Medical Cases

[Feedback](#) | [Take Our Survey](#)

Each interactive case presents an evolving patient history and a series of questions and exercises designed to test your diagnostic and therapeutic skills. You will receive immediate feedback on your answers and treatment choices, along with the opportunity to compare your final score with those of your peers. Video, animation, and interactive content allow you to learn more about mechanisms, diagnostic tests, and treatments.
