# Kenya Urban Reproductive Health Initiative (Tupange)

## Report of the 2010 Baseline Household Survey

October 2011

This report presents some of the key findings from the Tupange/MLE 2010 baseline household survey, which was designed by the Measurement, Learning & Evaluation (MLE) project of the Urban Reproductive Health Initiative and Tupange, the Kenya Urban Reproductive Health Initiative, and executed by the Kenya National Bureau of Statistics (KNBS). Tupange is being implemented by a consortium led by Jhpiego and including its partners, Center for Communication Programs (CCP), Johns Hopkins University; Marie Stopes International (MSI); National Coordinating Agency for Population and Development (NCAPD); and Pharm Access Africa Limited (PAAL). The MLE project is implemented in Kenya by the Carolina Population Center (CPC) at the University of North Carolina at Chapel Hill (UNC) and the African Population and Health Research Center (APHRC). The opinions expressed in this report are those of the authors and do not necessarily reflect the views of the donor organization, the Bill & Melinda Gates Foundation.

# Preface

---

Over the last decade, Kenya's population grew from about 29 million in 1999 to roughly 39 million in 2009. This rapid growth has contributed to a host of challenges for government and citizens alike. Leaders are increasingly committed to slowing population growth to sustainable levels.

Several key national documents, including Kenya's new constitution, address reproductive health in general and family planning explicitly. In the new constitution, Article 43 on economic and social rights gives specific attention to health rights by declaring that "every person has the right to the highest attainable standard of health, which includes the right to health care services, including reproductive health care." Vision 2030 (a development plan for the economic, social and political pillars of Kenya) aims to transform Kenya into a "middle-income country providing a high quality of life to all its citizens in a clean and secure environment" by 2030. Family planning has been identified as a key strategy if the vision is to be achieved. These documents have sparked a robust national dialogue around family planning. In November 2010, a National Population Leaders' Conference was convened whose theme was Managing Population to Achieve Vision 2030: Healthier Families for a Prosperous Kenya.

In line with these strategies and the Millennium Development Goals, the Government of Kenya has set the goal of increasing the use of family planning to 70 percent of women aged 15–49 by 2015.<sup>2</sup>

In this context, where decision-makers recognize the ever-increasing importance of family planning, it is my pleasure to present the final report of the 2010–2011 Kenya Baseline Survey of the Tupange Urban Reproductive Health Initiative for public use.

Information was collected in five cities (Nairobi, Kisumu, Mombasa, Kakamega and Machakos) from a sample of over 13,000 households. Eligible women and men aged 15–49 in selected households were asked about their background characteristics, sexual activity, fertility levels, desired family size, knowledge and use of family planning methods, maternal and child health practices, spousal communication, and women's empowerment and movement.

Although many surveys have been done in Kenya investigating family planning, this survey has unique characteristics that make it exceptionally useful for decision-makers. For example, it is the first survey to look at urban family planning with a focus on the urban poor. It is the first time that data have been collected at the city level, with large enough sample sizes to be representative. Moreover, the survey created an urban sampling frame that can be used for future urban surveys on any topic. The aggregate result is a set of city-level data that provide actionable insights specific to each of Kenya's major urban areas.

The report will be essential not only for the Tupange project intervention, for which it was specifically designed, but also for the greater community of public and private actors working toward achieving the national health goals described above. My hope is that this study will be widely used to inform policies, programs, projects and future research, as we all work together to make family planning a social norm and reach our ambitious national goals.

---

<sup>2</sup> Ministry of Health, The Second National Health Sector Strategic Plan of Kenya (NHSSP II-2005-2010).

On behalf of the Government of Kenya, I wish to acknowledge the generous support of the Bill & Melinda Gates Foundation to the success of this survey. I also wish to thank the institutions and individuals who provided technical support to the survey process, including MLE, The University of North Carolina, the African Population Health Research Center, The Tupange team led by Jhpiego-Kenya, and Susan Rich of the Bill & Melinda Gates Foundation. We look forward to collaborating further throughout the implementation phase of the Tupange project.

Director, Public Health and Sanitation  
Ministry of Public Health and Sanitation

# Foreword

---

The Bill & Melinda Gates Foundation launched the Urban Reproductive Health Initiative (URHI) as part of its Family Planning/Reproductive Health (FP/RH) Strategy, with the goal of significantly increasing modern contraceptive prevalence rates in selected urban areas of Kenya, Nigeria, Senegal and Uttar Pradesh-India. The Measurement, Learning & Evaluation (MLE) project is serving as the main source of support to implementing country consortia and the Bill & Melinda Gates Foundation in the collection, analysis, use and communication of evidence of URHI. Since its inception in early 2009, MLE has been providing technical assistance to country consortia and taking the lead in planning and executing the comprehensive baseline surveys in the target countries.

We are delighted to present the baseline household survey report for Kenya, which was designed and written by the MLE project constituents—the Carolina Population Center at the University of North Carolina at Chapel Hill (CPC-UNC) and the African Population and Health Research Center (APHRC)—in collaboration with and with inputs from the Kenya Urban Reproductive Health Initiative (Tupange).

The baseline household survey was executed in the five target cities and urban centers (Nairobi, Mombasa, Kisumu, Kakamega and Machakos) by the Kenya National Bureau of Statistics (KNBS) with oversight from MLE and Tupange. We would like to acknowledge the leadership, leveraging of resources and dedication of KNBS staff at various levels, in particular Dr. Collins Opiyo, Director of Population and Social Statistics; and the late Christopher N. Omolo, Senior Manager, Population and Social Statistics; Macdonald G. Obudho, Acting Director, Population and Social Statistics; Robert Buluma, Manager, Population and Social Statistics; and the KNBS teams from the survey sites. We are grateful to Dr. Boniface K’oyugi, Director General, National Coordinating Agency for Population and Development (NCAPD), Ministry of State for Planning and Vision 2030, for his leadership and technical advice. We wish to acknowledge Dr. Issak Bashir, Head, Division of Reproductive Health, Ministry of Public Health and Sanitation; and his team including Dr. Shiphrah Kuria, Deputy Head; Anne Njeru, Program Officer; Diana Kamar, Program Officer; and John Mwangi, Program Officer, for their valuable input during the survey.

We would also like to acknowledge the untiring effort by the entire MLE team at CPC-UNC and APHRC, namely, Prof. David Guilkey, Project Director; Dr. Ilene Speizer, Deputy Director; Mrs. Beverly Tucker, Deputy Director; Dr. Gwendolyn Morgan, Technical Lead; Mr. Paul Kuria, Kenya Country Manager; Mr. Joshua Davis, Technical Officer; Mr. Michael Mutua, Data Analyst; and Mrs. Mercy Ndwiga, Program Assistant. We are also grateful to Ms. Caroline Blair and Ms. Manya Dotson, consultants who finalized this report, working with dedication on the drafts prepared by MLE.

The baseline survey and its report benefited greatly from the contributions of the Tupange team, namely, Dr. Linda Archer, Jhpiego Kenya Director M&E; Mr. John Mark Udalang, M&E Advisor; Debbie Gachuhi, Senior Demand Creation Advisor; Walter S. Odhiambo, Senior Private Sector Advisor; George Kichamu, Senior Advocacy and Policy Advisor; Parmindar S. Lotay, Senior Logistics Advisor; and Alan Johnston, Consultant, Advocacy. We are grateful for the leadership and management support provided by the Jhpiego team, Dr. Isaac Malonza, Kenya Country Director; Dr. Ronald H. Magarick, Director, Global Programs; Ronald Geary, Chief Financial Officer; Dr. Pamela Lynam, Senior Technical Director; Rajshree Haria, Director, Finance and Administration; Stuart Merkel, Senior Program Advisor; and Titus Wambua, Internal Auditor.

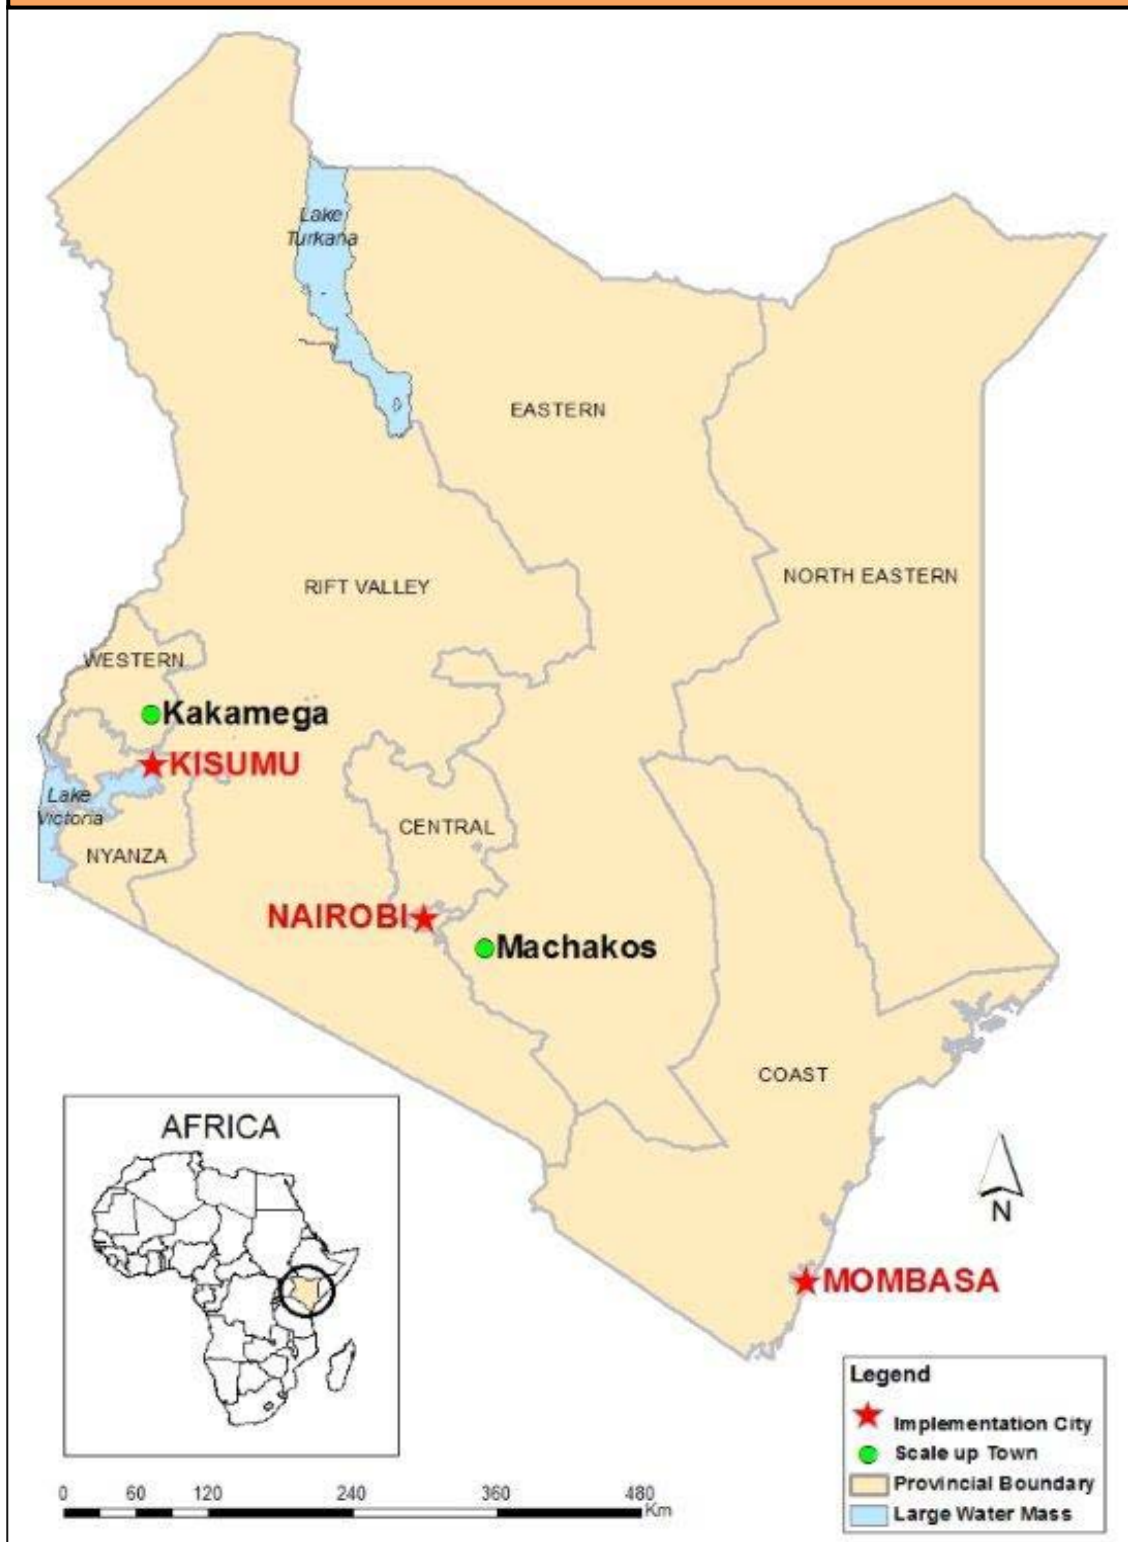

It is our sincere hope that this report, along with the Kenya Technical Working Paper (which describes trends and differential in key family planning and reproductive health indicators in urban Kenya over the last 15 years), will help Tupange fine-tune its program of intervention geared toward significantly increasing the contraceptive prevalence rate in the intervention sites.

# Map of Kenya Showing the Provinces and Five Urban Areas in the Tupange

# Executive Summary

---

## Background

This report summarizes the findings of a household survey undertaken between September and November 2010 as part of the impact evaluation of Tupange, the Kenya Urban Reproductive Health Initiative. By providing time-series data on key indicators, the survey, carried out by Measurement, Learning & Evaluation (MLE) of the Urban Reproductive Health Initiative project, provides an evidence base for the outcomes and impact of both demand side interventions (those that increase the uptake of contraception) and supply side interventions (those that increase the quality of and access to family planning [FP] services). This survey is the first of three that are planned and provides a baseline for follow-on assessments and information that will inform program design.

## Methodology

A total of 13,140 households were selected for interviewing, ensuring that the sample was sufficient to allow analysis of the findings by each of the five intervention sites. With the exception of Machakos and Kakamega, the sample in each urban area was apportioned equally between formal and informal localities. All women aged 15–49 years who were either usual residents or visitors present in the sampled households on the night prior to the survey were eligible for a detailed interview. In addition, in half of the sampled households in Nairobi, Mombasa, and Kisumu, all men aged 15–59 years were asked to participate in a detailed interview. Response rates were high, at over 84 percent.

## Summary of Findings

Overall, the survey found that there is significant unmet need for family planning in all cities, with the need being slightly higher in Mombasa. Unmet need was much greater for unmarried, sexually active women. For this group, unmet need ranged from a low of 22 percent in the middle quintile in Nairobi to a high of 68 percent in the poorest quintile in Mombasa. Knowledge of contraceptive methods was found to be universally high among both women and men surveyed, although there is some variability in knowledge of specific methods. In Nairobi, Mombasa and Kisumu, use was slightly higher among women in higher (richer) wealth quintiles. For example, while 40 percent of the poorest in Nairobi used family planning, 45 percent of the richest were users.

**Sources of Family Planning.** Public health facilities were the most important source of contraceptive methods regardless of urban area, although family planning users in Nairobi and Mombasa reported using private sources more frequently. In each of the cities, the percentage of women offered information on other methods ranged from 68 to 83 percent for those choosing the injectable, 69 to 86 percent for the pill, 82 to 92 percent for implants, and 72 to 97 percent for the IUCD.

**Misinformation about Family Planning.** The results show high levels of misinformation around family planning use in all cities. A majority of female respondents in all five cities believed seven out of eight myths presented. For example, in Kakamega 57 percent of women surveyed believe that use of a contraceptive injection could make a woman permanently infertile. Regarding the association between contraception and female promiscuity (the belief that women who use contraception may become promiscuous), between 18 percent (Kisumu) and 41 percent (Machakos) of women believed the statement to be true.

***Reasons for Not Using Family Planning.*** The most commonly mentioned reason for not using family planning was infrequent or no sex, which was stated by between 39 and 60 percent of women in all cities. A much lower percentage of women (9 to 13 percent) were non-users because they were trying to get pregnant. Reasons for non-use given by male respondents were similar to those given by women, with infrequent/no sex being the most popular. Within this sample of non-using women, fear of side effects was mentioned among 10 to 16 percent of women. Very few women reported non-use due to partner or religious opposition or because of lack of knowledge of methods or method sources.

***Attitude toward Family Planning Service Delivery.*** Taken as a proxy for satisfaction (among ever users) and perceptions of quality (among never users), the data suggest that quality service delivery appears to be high (i.e., few respondents agreed with the statements that service was poor) in all cities regardless of a woman's socioeconomic status. The largest variation came in response to the statement "women don't like the way they are treated in family planning clinics around here," where only 9 percent of women in Kisumu agreed compared with 25 percent in Nairobi.

***Sexual Behavior.*** For all cities and wealth quintiles, a majority of women had engaged in sex by 20 years of age. Sexual debut occurred earlier in the poorer wealth quintile regardless of urban area of origin. In Kisumu, 75 percent of women in the poorest wealth quintile had engaged in intercourse by age 17, compared with only 35 percent in the richest wealth quintile. Nairobi saw a similar disparity, with 49 percent of women in the poorest wealth quintile experiencing sexual debut by the age of 17 compared with 21 percent of the richest. In Mombasa, while only 6.8 percent of women in the richest quintile reported having had sex by age 17, over 23 percent of the poorest had sex.

***Unmet Need.*** On average, among all women who reported an unmet need for a family planning method, more women felt a need to space than limit future births. With few exceptions, among currently married women, the unmet need for a spacing method is greater across all cities and wealth quintiles than the unmet need for limiting births. Among the five cities, unmet need for currently married women ranged from a low of 18 percent in the richest quintile in Nairobi to a high of 41 percent in the poorest quintile in Mombasa. Analysis of the data on total unmet need among currently married women by wealth quintiles showed that unmet need tended to fall as income rose in Nairobi, Mombasa and Kisumu. The poorest quintile tended to have the largest proportion of women reporting an unmet need for family planning and this proportion declined as wealth increased. In the remaining two cities, however, this pattern was not observed. Regardless, meeting the unmet need of the poorest segment of the population appears to be a critical need.

***Integration of Family Planning Counseling.*** In all cities, women were more likely to get FP counseling after delivery (varying from 37 percent in Mombasa to 56 percent in Machakos) than before delivery (between 4 and 12 percent). Women who received information both before and after delivery ranged between 4 and 8 percent. The pattern that emerged across all five cities was that child health services were more likely to be integrated with FP services than maternal health services.

***Access to Skilled Delivery.*** Across the five study sites, the majority of births were assisted by skilled health workers (composed of doctor/clinical officer and nurse/midwife teams), ranging from about 75 percent in Mombasa, Kisumu and Kakamega to 90 percent in Nairobi. Noticeably the proportion of births delivered by traditional birth attendants remains high in Kisumu, at nearly 15 percent, and in Mombasa, almost 11 percent of respondents reported being delivered by a friend or relative.

**Fertility Knowledge.** Knowledge of the fertile period among both men and women and between cities was found to be low, ranging from 13.5 to 33 percent, showing that basic knowledge of reproductive physiology also remains low.

**Spousal Communication and Women's Empowerment.** Communication between spouses about family planning was found to be high, with at least 60 percent of women in a union reporting that they discussed using family planning or the number of children that they would like to have with their spouse. Among those who did discuss family planning, the majority (at least 60 percent across all five cities) had this discussion at least once in the preceding six months. All women surveyed were asked: "If you wanted to use a method of family planning, would you need anyone else's permission?" The responses varied greatly across cities, with 23 percent of women in Kakamega and 26 percent of women in Nairobi responding yes to the question, compared to 51 percent in Machakos. When asked how the decision on FP method type was made (among ever users), between 31 percent (Mombasa) and 54 percent (Kakamega) said the decision was largely made mainly by the woman alone.

Men reported even higher levels of discussion of family planning than did women, with approximately 75 percent of men in a union reporting discussing FP with their partners. Among those who reported having discussed FP, at least 85 percent in every urban area reported having the conversation at least once in the last six months. In addition, about 90 percent of the men in each urban area said that talking about family planning with their partner was "easy." In Nairobi and Mombasa, about 40 percent of men report that both partners initiated the discussion about family planning.

## Key Recommendations Based on Survey Results

In addition to serving as an evaluation tool, this survey is meant to guide programmatic activities. Insights gleaned from the research lead to the conclusion that Tupange's focus on the urban poor is addressing a key gap in unmet need. In addition, the research leads to several strategic recommendations for project implementation. In summary, Tupange should:

- Focus on youth
- Focus on increasing knowledge about long-acting and permanent methods
- Dispel myths and reassure clients about the safety and effectiveness of all FP methods
- Encourage health providers to provide more counseling on coping with side effects
- Use alternative media, such as SMS and mobile phones to address youth with demand-creation activities
- Strengthen private sector services
- Develop stronger linkages between public and private clinics to manage access and referrals
- Design messages to reinforce spousal communication around FP
- Encourage male involvement in decision-making on family size and planning
- Maximize integration of FP in other health services and particularly postpartum care
- Expand community health worker capacity to do demand creation for FP and offer FP services, where possible
- Strengthen linkages between community health workers and health facilities through improved referral systems, access to commodities and supportive supervision

# Chapter 1. Introduction

---

## 1.1. Background

Kenya is situated in the eastern region of the African continent and is bordered by the nations of Ethiopia, Somalia, Tanzania, Uganda and South Sudan and by the Indian Ocean. Kenya occupies a total area of 582,646 square kilometers with a population density of about 68 people per square kilometer, significantly higher than the world average of 49. Kenya is divided into three agro-ecological zones: the coastal lowlands, the highlands, and the arid and semi-arid lands. The country has a diverse terrain ranging from the lake and coastal basins to the rugged Rift Valley and mountainous highlands. It has over 40 different ethnic groups resulting in diverse cultural traditions. Religion in Kenya is dominated by Christianity (90 percent) and Islam (7.4 percent) (Kenya National Bureau of Statistics [KNBS] and ICF Macro, 2010).

Kenya gained independence from British rule in 1963 and established a multiparty state in 1991. In 2010, a new constitution was voted on and accepted, although at the time of this survey it had not been fully implemented. Under the new administration, there will be two levels of government: national and county. At the national level, there will be an upper house (senate) and a lower house (the national assembly). The structure of the county governance includes county assemblies, executive committees and public service. Each county is to be headed by a Governor (Constitution of Kenya, 2010).

The new constitution, promulgated in 2010, recognizes that every person has the right to the highest attainable standard of health, including reproductive health (National Council for Law Reporting, 2010). Recent information and policy development suggest that the national government will be responsible only for the health policy, training and national referral health facilities, while the county governments, under the leadership of an elected Governor, will be responsible for health facilities within their county and primary health care (Human Resources for Health Task Force, 2011). Hiring of health care providers will remain the responsibility of the central government based on analysis and projections to be undertaken at the county level,<sup>3</sup> while hiring and management of support staff will be devolved to the counties. The City of Nairobi and other county councils will no longer be responsible for providing or managing health services (Nyanchoga, 2011). If experience from the existing Community Development Funds (CDF)<sup>4</sup> continues, health and education are likely to be the top demands in the policy debate.

The Government of Kenya, generally perceived as investment-friendly, has enacted several regulatory reforms to simplify both foreign and local investment after several years of consistent decline between 1970 and 2000. As a result of the strong growth performance recorded since 2002, real per-capita income increased at an annual average rate of about 3 percent while poverty declined from 56.8 percent in 2000 to 46 percent in 2006 (IMF Country Report No. 10/224, July 2010).

Kenya's economy is currently market-based, with some state-owned infrastructure enterprises, and maintains a liberalized external trade system. The country has a fast growing social and physical infrastructure and is generally perceived as Eastern and Central Africa's hub for financial, telecommunications and transportation services. An increasingly significant portion of Kenya's foreign income is from remittances by non-resident Kenyans who work abroad. Though the country suffered a slow real GDP growth rate in 2008 of 1.7 percent (due to several factors,

---

<sup>3</sup> Implementation has not taken place yet but cabinet memos have been drafted and preparatory work is at an advanced stage.

<sup>4</sup> This is an allocation of funds from tax revenue that was put under the management of the Members of Parliament, each with a specific amount.

one of the most significant being the 2007 post-election violence), more favorable growth was recorded in 2009 and 2010, with rates of 2.6 and 5.6 percent, respectively (KNBS Economic Survey, 2011). The recent increased growth rates are attributable to expansion in many sectors, most notably tourism, construction and agriculture.

In 2009, Kenya's population was estimated at 38.6 million people, up from 28.7 million in 1999, 21.4 million in 1989 and 15.3 million 1979 (CBS,1979, 1989, 1999; KNBS, 2010). This is an increase by a factor of 2.5 over 30 years, or an average growth of more than 3 percent per year. The population growth rates have been on a downward trend since 1989 from 3.4 percent to about 3.0 percent in 2009 (KNBS, 2010), resulting in a total population estimated at 41 million in 2011. Declines in fertility rates over recent decades reflect Kenyans' desire for smaller families and increased use of contraception, indicating some success in the implementation of the efforts of the National Population Policy for Sustainable Development (NCPD, 2000).

Kenya is characterized by a youthful population with about 42 percent of Kenyans under 15 years of age and roughly 21 percent aged between 15 and 24 years. Only 3 percent of Kenyans are aged 65 and older. One-third of Kenyans (32 percent) currently live in urban areas, marking a significant rate of urbanization. Between 1960 and 1990, the percentage of Kenyans living in urban areas rose from about 7 percent to about 18 percent. Depending on the urban area, 60 to 80 percent of Kenya's urban population live in informal settlements that are characterized by lack of access to water and sanitation, insecure land tenure, lack of adequate housing, poor environmental conditions and high crime rates. For instance, in Nairobi, 60 percent of the population lives in informal settlements that occupy only 5 percent of the total land area. UN-HABITAT estimates that the population living in Nairobi informal settlements is expected to double within the next 15 years. Furthermore, only 22 percent of these households in Nairobi have water connections and 75 percent have access to water through water vendors (UN-HABITAT, Nairobi Urban Sector Profile, 2006; UN-HABITAT, 2008; Oxfam GB, Kenya Program, 2009).

Kenya's total fertility rate (TFR) has declined substantially in the last 40 years, in large part due to a growing acceptance of family planning (FP) and increased contraceptive availability. From a TFR of more than eight children per woman in the 1970s, fertility rates dropped to 4.6 by 2008. Unlike the well documented successes of increased contraceptive prevalence rates (CPR) and declining TFR, mortality rates increased in the 1980s due in large part to increased deaths from the HIV/AIDS epidemic, an overall deterioration in health services and widespread poverty (National Council for Population and Development, 2000). Since the early 1990s, Kenya has been grappling with the AIDS epidemic, which eroded hard-won progress in health and mortality rate indicators. These factors have led to substantial declines in the average life expectancy. Of note is that Kenya, unlike other countries in sub-Saharan Africa, has in the past 10 years recorded an increase in the maternal mortality ratio from 414 maternal deaths per 100,000 live births in 2003 to 488 in the decade preceding 2009 (KNBS, 2010), suggesting inadequate maternal care.

## **1.2. Objectives of Tupange, the Kenya Urban Reproductive Initiative**

The Bill & Melinda Gates Foundation's reproductive health strategy aims to reduce maternal and infant mortality and unintended pregnancy in the developing world by increasing access to high-quality, voluntary FP services. The reproductive health strategy is being implemented at the country level through the Urban Reproductive Health Initiative (URHI) being implemented in Kenya, Nigeria, India and Senegal.

In Kenya, the URHI, hereinafter referred to as Tupange, is composed of lead partner Jhpiego, Pharm Access Africa Limited (PAAL), Marie Stopes Kenya (MSK), the Johns Hopkins Center

for Communication Programs (JHU/CCP) and Kenya's National Coordinating Agency for Population and Development (NCAPD). The partnership works in close collaboration with the Ministry of Health and local city councils. The main objective of the project is to increase modern contraceptive use in Nairobi, Mombasa and Kisumu by 20 percentage points over the five-year life of the project. The urban centers of Machakos and Kakamega are additional "delayed" interventions sites that are included in the baseline data collection presented here although data in these delayed sites were collected only from women.

Key elements of the Tupange include:

- Integrating high-quality FP services with maternal and newborn health services, especially post-abortion, postpartum, antenatal care and HIV/AIDS services;
- Improving the overall quality of FP services, particularly in high-volume settings;
- Increasing access to FP services for the urban poor through public-private partnerships and other private sector approaches;
- Creating sustained demand for FP services among the urban poor; and
- Creating a supportive policy environment for ensuring access to FP supplies and services, particularly for the urban poor.

By reaching urban women with the greatest need, this comprehensive strategy is expected to increase contraceptive use among women in urban and peri-urban areas and potentially diffuse to rural areas to which urban women are linked (Cleland et al. 2006).

The Measurement, Learning & Evaluation (MLE) Project is the evaluation component of the URHI. The goal of the MLE project is to promote evidence-based decision-making in the design of integrated family planning and reproductive health (FP/RH) interventions for the Initiative. The MLE project was initiated prior to any of the interventions so that baseline conditions could be accurately measured.

A baseline survey with a representative sample of women in selected cities was conducted prior to the implementation of the program. This report presents the key survey findings. A mid-term survey with the same women will be conducted two years following the baseline, and a final survey will be done with the same women at end line (four years after baseline data collection). This approach will permit rigorous assessment of the impact of program interventions on women's fertility and contraceptive use outcomes. In addition, data collected from a representative sample of men at baseline, mid-term and end line will determine the extent of change in men's knowledge of, attitudes toward and practices relating to contraception in the intervention cities. In addition to providing data for program evaluation, the baseline data will also be used by the Tupange project to inform program design.

This report presents descriptive findings from baseline data collected in five cities in Kenya (Nairobi, Mombasa, Kisumu, Machakos, and Kakamega). All tables in this report present data disaggregated by urban area.

### 1.3. Methodology

A key objective of the MLE project is to undertake a rigorous impact evaluation of the Urban RH Initiative country programs (this initiative is called Tupange in Kenya). By providing time-series data on key indicators, the MLE project will provide an evidence base for the outcomes and impact of demand-side interventions (those that increase the uptake of contraception, and supply-side interventions).

#### 1.3.1. Organization of the Survey

The survey sampling frame was developed by the Kenya National Bureau of Statistics (KNBS) which also planned and conducted the training for the survey field workers, collected the data and entered the data from the survey questionnaires (which can be seen in Attachment 2). The African Population and Health Research Centre (APHRC) provided in-country technical assistance to KNBS to ensure that data were gathered according to a standard, scientific protocol and participated in data analysis. Jhpiego, an international non-profit health organization affiliated with The Johns Hopkins University (and the lead partner in the country-level project consortium), provided administrative assistance and managed and carried out the dissemination of the survey results. Other partners and stakeholders of Tupange are Marie Stopes Kenya (MSK), the National Coordinating Agency for Population and Development (NCAPD), the Johns Hopkins University Center for Communications Programs (JHU/CCP), the Division of Reproductive Health (DRH) in the Ministry of Public Health and Sanitation, and Pharm Access Africa Limited (PAAL). The Tupange partners jointly provided technical inputs during the development of the survey instruments and NCAPD conducted community sensitization to help maximize response rates. The Carolina Population Center, University of North Carolina, Chapel Hill (UNC), provided the overall study design and execution for this survey and led the data analysis.

#### 1.3.2. Sample Design

The household survey sample was drawn from the population residing in the five cities/urban centers. The most recent Population and Housing Census (2009) was used to identify clusters from which a representative sample of households for each city/urban center was drawn. A total of 13,140 households were selected for interviewing, ensuring that the sample was sufficient to allow analysis of the findings by each of the five intervention sites. Nairobi was intentionally oversampled (4,260 vs. 2,220 households) due its significantly larger size. With the exception of Machakos and Kakamega, the sample in each urban area was apportioned equally between formal and informal localities.

A two-stage cluster sampling design was used for each urban area. Stage one involved selecting a random sample of clusters in each urban area. In Nairobi, 71 clusters were randomly selected in each of the formal and informal areas (domains), for a total of 142. In Mombasa and Kisumu, 37 clusters were randomly drawn from each domain, for a total 74 per urban area. In Machakos and Kakamega, 74 clusters were randomly selected per urban area. In the second stage, a random sample of 30 households was selected within each selected cluster. Interviews with women took place in all households selected. In Nairobi, Mombasa and Kisumu, half of the households (15) in each of the selected clusters were also selected to interview men.

For each household selected, an interview with the head of the household (or his or her representative) was conducted. Each interview assessed household assets and environmental circumstances such as sanitation and housing materials, obtained a listing of usual residents of the household and asked about demographic characteristics of the head of the household.

All women aged 15–49 years who were either usual residents or visitors present in the sampled households on the night prior to the survey were eligible for a detailed interview. In addition, in half of the sampled households in Nairobi, Mombasa and Kisumu, all men aged 15–59 years were asked to participate in a detailed interview.

Interviews took place in a location where the respondent could be assured some level of privacy and were conducted by a same-sex interviewer using a paper-and-pencil questionnaire following the receipt of informed consent.

Respondents were asked about demographic characteristics, for information on current and past FP method use, fertility desires and intentions, health-seeking behaviors for themselves and their children, how they pay for health care services, exposure to FP messages, and migration patterns, using a structured questionnaire. At mid-term and end line, the objective will be to find the same female respondents, so contact information was requested to permit extensive tracking procedures at each follow-up round of data collection. Repeated cross-sections of men (not necessarily the same ones) will be interviewed at mid and end line. (Table 1.1 provides full details, including response rates, of the interviews conducted.)

Table 1.1: Number of Interviews, by type and urban area, Tupange/MLE, Kenya, 2010						
Urban area	Household Survey		Individual Interviews			
	Selected	Completion rate	Women		Men	
			Selected	Completion rate	Selected	Completion rate
	n	Percentage	n	Percentage	n	Percentage
Nairobi	4,230	83.8	3,284	82.4	1,817	70.0
Mombasa	2,220	84.4	1,726	84.9	967	70.1
Kisumu	2,190	85.5	1,944	82.5	1,031	53.7
Machakos	2,220	90.9	1,965	93.3	N/A	-
Kakamega	2,220	75.9	1,583	83.6	N/A	-
Total	13,080	84.0	10,502	85.1	3,815	65.6

### 1.3.3. Questionnaires

Three questionnaires were used to collect baseline information—one for each of the households, one for women and one for men. In Machakos and Kakamega, only women were interviewed. Questionnaires were based on the questionnaires used by the Demographic and Health Survey program in Kenya but were modified and expanded by all in-country partners to reflect MLE and Tupange objectives.

Questionnaires were translated from English into Kiswahili, Luhya, Kamba and Dholuo—the four most commonly spoken languages in the five cities. Final revisions were made to the questionnaires following extensive pre-testing and training of field staff.

The household questionnaire was administered prior to the women’s and men’s questionnaires to facilitate the identification of eligible household members. The methodology and questionnaires were tested in Kisumu and Nairobi August 5–8, 2010, in clusters outside the planned intervention areas to minimize chances of contamination. Survey instruments were finalized based on feedback from and lessons learned during the pre-test.

### 1.3.4. Training

The KNBS recruited research assistants and supervisors based on a set of defined criteria, including experience with large-scale, national-level, population-based surveys.

The final team included 31 supervisors, 93 female research assistants, 27 male research assistants, 31 field editors and 12 reserves. APHRC hired six quality assurance personnel.

Training of the research team was undertaken from September 4 to September 15, 2010. Technical and program staff from KNBS, NCAPD, MOH, MLE and APHRC served as trainers and divided participants into four groups to train them on questionnaire administration, logistics and Tupange objectives using manuals to ensure that the team was fully briefed on survey contents and procedures. A mix of training techniques including class presentations, mock interviews and practice interviews in the field was used.

Supervisors were given supplementary training on the identification of clusters and households for the survey, distribution of assignments to the research assistants, accounting for the completed questionnaires, and what to look out for when carrying out the initial editing of the questionnaires while in the field. All trainees were taken for practice interviews in households in selected clusters in the town of Nakuru. Each trainee was tasked with collecting data for two of each of the questionnaires depending on the availability of the eligible respondents at the household level. During the last day of the training, the final field teams were formed and supervisors, research assistants and field editors were identified.

The quality assurance staff received a three-day training prior to participating in the main survey training for field workers. The team was trained on various techniques of monitoring data quality and how to give feedback to the field teams on common errors found on the questionnaires.

### 1.3.5. Fieldwork

Staff from APHRC, MOH, NCAPD, Jhpiego and KNBS participated in the fieldwork supervision. In order to ensure that the selected communities were receptive to fieldwork staff, NCAPD and KNBS district statistical officers organized and implemented a series of social mobilization activities in the clusters sampled for the survey before sampling began. Community *barazas* (gatherings held to raise awareness and share collective wisdom) were held with community members, the local administration and management bodies of the residential areas, and village elders were used to inform the target communities about the survey plans. Due to the short time between the social mobilization activities and the beginning of data collection, many community members did not receive information about the survey. This may have affected overall response rates (see Table 1.1).

### 1.3.6. Response Rates

Of the 13,140 households selected for inclusion in the sample, 12,565 were occupied and eligible for interviews. Of these, 10,992 households were interviewed successfully (197 declined), a response rate of 84 percent. There were a total of 10,502 eligible women, of whom 8,932 consented and participated in an interview, yielding a response rate of 85.1 percent. There were 3,815 eligible men, of whom 2,503 consented and participated in an interview, a response rate of 65.6 percent.

For the household survey, non-response was primarily due to the absence of a suitable member of the household during each of three visits (37 percent; not displayed). Non-responses during the male and female interviews were due mainly to the subject's absence at the time of the household interview (76 percent and 78 percent respectively) or at any of the three follow-up visits.

### 1.3.7. Data Processing

A data processing team was selected and trained at the KNBS offices in Nairobi. Most of the data processing staff were selected from the reserve members from the field survey teams. Staff from MLE and APHRC conducted the five-day training between October 26 and November 1, followed by on-the-job training for an additional four days. Fifteen data entry clerks, four office editors, one system administrator, one supervisor and one manager participated in the training. Data processing began in November 2010 and was finalized in March 2011.

To ensure that all questionnaires were processed, a “data audit” was conducted and completed at the end of March 2011. The tabulation of the survey results, particularly the program tables, was done in May 2011. Data analysts from the University of North Carolina and APHRC produced the tables and preliminary results that were shared with program teams on June 2–3, 2011. Further analysis of the data that allowed inclusion of results regarding additional indicators was completed by July 2011 and an initial draft baseline report was prepared by mid-September 2011.

# Chapter 2. Characteristics of Household Population and Respondents

---

This chapter presents demographic and socioeconomic information captured by the household questionnaire, including the age and sex composition of sampled households for all five cities, and presents sex ratios for the overall population and for children aged six years and younger. This chapter also summarizes household characteristics, including whether or not there was electricity, source of water supply, materials from which sampled houses are constructed, and the presence or absence of flush toilets. Also included is the distribution of household wealth within the sampled population for each urban area.

## 2.1. Household Population by Age and Sex

Table 2.1 displays the distribution of households from the five cities surveyed. The total household population for the survey is 37,120 persons, the female-to-male ratio being almost equal at 50.4 women to 49.6 men. Data on age distribution indicate that the cities contain a largely young population, with the proportion of the total population aged 15 years or younger ranging from 31.7 percent (Nairobi) to 40 percent (Kisumu). Between 52 percent (Kakamega) and 64 percent (Nairobi) of the female population are within reproductive age (15–49 year old). A low proportion between 1.9 percent (Kisumu) and 5 percent (Machakos) of the population in each urban area is over age 60. As expected, within these major urban areas, there is a large proportion of people (between 58 percent 66 percent) of working age (15–59 years).

Table 2.1: Distribution of household members by age groups and sex, with household sex ratio, by urban area, Tupange/MLE, Kenya, 2010

Age	Nairobi			Mombasa			Kisumu			Machakos			Kakamega		
	Male	Female	Total	Male	Female	Total	Male	Female	Total	Male	Female	Total	Male	Female	Total
0 – 4	14.1	14.3	14.2	13.4	14.3	13.9	15.9	17.1	16.5	11.4	11.0	11.2	15.8	15.0	15.4
5 – 9	9.6	9.5	9.5	11.3	11.5	11.4	12.3	13.5	12.9	10.8	9.6	10.2	10.9	11.2	11.0
10–14	8.2	7.8	8.0	9.9	9.1	9.5	10.6	10.4	10.5	11.1	10.0	10.6	10.3	12.2	11.3

50–54	2.2	1.5	1.8	3.4	2.7	3.1	2.1	1.8	1.9	3.7	4.3	4.0	3.0	4.0	3.5
55–59	1.0	1.1	1.0	1.9	1.5	1.7	1.6	0.7	1.1	2.7	2.9	2.8	1.8	1.7	1.7
60–64	1.0	0.9	1.0	1.6	0.8	1.2	1.0	0.6	0.8	1.9	1.7	1.8	1.4	1.3	1.4
65–69	0.7	0.4	0.6	0.6	0.9	0.7	0.5	0.5	0.5	0.9	0.9	0.9	1.0	0.9	1.0
70 +	0.5	0.5	0.5	0.9	0.6	0.8	0.4	0.7	0.6	1.9	2.7	2.3	1.4	1.5	1.4
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Number 0–4 years	760	765	1,525	432	465	897	550	612	1,163	378	385	763	481	452	933
Number all	5,387	5,349	10,736	3,223	3,250	6,472	3,462	3,580	7,042	3,316	3,499	6,815	3,042	3,013	6,055
Sex ratio, age 0–4 years*			99			93			90			98			106
Sex ratio, all ages*			101			99			97			95			101

The overall sex ratio for Nairobi and Kakamega is 101 males to 100 females, while the ratios for Mombasa, Kisumu and Machakos (99, 97, and 95 males, respectively to every 100 women) are slightly skewed in favor of females.

## 2.2. Household Environment and Characteristics

The presence or absence of electricity and drinking water and the materials used in home construction were used as proxies for income. Table 2.2 A presents housing characteristics of the study population. Since socioeconomic status can influence household members' health-seeking behavior and status, heads of household were also asked a series of questions about their dwellings and possessions. Water sources were classified as piped and non-piped, with the former referring to water piped into the dwelling, yard/plot, or a public tap. Since flush toilets are more hygienic than other systems of human waste disposal, information was also collected on their presence or absence.

Table 2.2A: Household characteristics by urban area, Tupange/MLE, Kenya, 2010					
Characteristic	Nairobi	Mombasa	Kisumu	Machakos	Kakamega
Electricity					
Yes	77.0	62.1	44.9	52.7	39.1
No	23.1	37.9	55.1	47.3	60.9
Source of drinking water					
Piped water	90.7	83.4	73.7	30.2	41.7
Non-piped water	9.3	16.7	26.3	69.8	58.3
Flooring material					
Finished floor	93.3	84.4	83.2	83.9	63.9
Unfinished floor	6.7	15.6	16.8	16.1	36.1
Main material of exterior walls					
Finished walls	93.9	81.6	73.8	90.1	55.8
Unfinished walls	6.1	18.4	26.2	9.9	44.2
Main material of roof					
Improved roof	98.4	94.2	99.3	100.0	94.8
Non-improved roof	1.6	5.8	0.7	0.0	5.2
Toilet					
Flush or pour flush toilet	60.0	36.9	18.6	27.8	18.5
Non-flush toilet	40.0	63.1	81.5	72.2	81.6

### 2.2.1. Household Wealth Index

The wealth index used in this report is based on data from the households' ownership of consumer goods, dwelling characteristics, sources of drinking water, toilet facilities and other characteristics that are related to a household's socioeconomic status. To construct the index, each of these characteristics was assigned a weight generated through principal components analysis. Each household was then assigned a score for each characteristic that equaled the weight assigned by the principal components analysis (e.g., owned the particular asset, had that particular source of drinking water, etc.) and zero otherwise. The sum of these characteristic scores formed the household's overall score. Households were then sorted into quintiles, with the first being the lowest quintile and the fifth being the highest. Quintiles were computed in each urban area independently and therefore the quintiles provide relative wealth within each urban area independently but not across the urban areas.

Table 2.2B: Household Distribution by wealth index and urban area, Tupange/MLE, 2010, Kenya 2010					
Wealth Index	Nairobi	Mombasa	Kisumu	Machakos	Kakamega
Poorest	24.7	25.9	25.3	21.8	23.9
Poor	21.4	21.0	20.2	20.8	20.5
Middle	19.5	20.5	19.0	18.7	20.2
Rich	18.8	18.2	18.2	19.9	18.7
Richest	15.6	14.5	17.4	18.7	16.6

As shown in Table 2.2B, the distribution of households by wealth quintiles indicates that regardless of urban area, wealth is not evenly distributed.

## 2.3. Background Characteristics of Respondents

This section describes a number of key characteristics of respondents, including educational attainment, social background and wealth index, all of which are important determinants of fertility preferences and contraceptive use. This chapter presents a socioeconomic profile of the women surveyed in all five cities and of men in the three cities (Nairobi, Mombasa, Kisumu) where men were surveyed.

### 2.3.1. Education, Religion and Economic Status of Respondents

Table 2.3 presents the percentage distribution of women and men by age, education, religion, wealth index, marital status and parity. As this table shows, the age distributions of the sampled women are similar, with about 40 percent classified as youth (15–24), although Kisumu has a slightly higher proportion of women in this age group (~48 percent). Half of all women sampled are under 30 years old.

Differences in age among cities are more pronounced among men. Specifically, in Kisumu, about 40 percent of men are aged between 15 and 24, whereas in Nairobi and Mombasa, the percentage is closer to 29 percent. While the reasons for this finding are unclear, it may be related to the fact that Kisumu has been particularly hard hit by the HIV/AIDS epidemic, which prior to the availability of antiretroviral therapy, saw increased mortality in the slightly older age groups. This may signal a need to focus even more programmatic attention to young people in Kisumu.

n/a = not available (Age range for men 15-59, for women 15-49)

Figure 2.1 shows the distribution of education for both men and women in all five cities. Not surprising, at least 50 percent of women and men in the cities studied had completed at least some secondary school (exception Mombasa). This is likely a consequence of better access to

schools and larger participation in the cash economy (resulting in higher disposable incomes) often found in major urban areas.

The proportion of women who had completed at least some secondary school ranged from 47 percent in Mombasa to 60 percent in Nairobi. Mombasa had the highest proportion of women who had never been to school, at 8 percent. Evidence worldwide shows that women’s education levels are directly related to contraceptive use, making girls’ education, at least through primary school, of particular importance. This finding suggests that it may be of particular importance for Tupange to target school-age girls as one of its target populations.

**Figure 2.1: Educational attainment by gender**

More men than women reported having completed at least secondary school in the three cities where male interviews were conducted. Nairobi had the highest proportion of men completing some secondary school, with 68.7 percent, and Kisumu the lowest, at 60.1 percent. The proportion of males without formal schooling is highest in Mombasa (3.3 percent) and lowest in Kisumu (0.8 percent).

Regarding religion, the majority of people surveyed were Protestants, accounting for more than half of the male and female populations in all five cities and for nearly three-quarters in each of Kisumu, Machakos and Kakamega. The rest of the population was largely Roman Catholic, accounting for approximately one-fifth of the population in all cities except for Mombasa, which has a large Muslim population (35 percent). In all other cities, Islam and other religions accounted for less than 7 percent of the overall population.

The wealth index displayed in Table 2.3 is based upon the individual’s household wealth value. Women in the poorest wealth quintile ranged from 15 percent in Machakos to 19 percent in Kisumu. Women in the five cities were somewhat evenly distributed in wealth, with Machakos having the greatest variation (15.4 percent in the poorest, 24.4 in the richest).

### 2.3.2. Current Marital Status

In all cities, the majority of women surveyed reported being currently married or living with a partner. This percentage was in excess of 60 percent in Kisumu and Kakamega. In addition, in all cities, between one-fourth (in Kisumu) and one-third (in Nairobi) of surveyed women were never married, likely a result of the high proportion of survey respondents in the two youngest age categories. That said, all men in Kisumu had a notably higher rate of never having been married (almost 42 percent) than any other group, while only 27 percent of women from Kisumu reported the same. The percentage of women who were separated, divorced or widowed

accounted for approximately 10 percent of women in all cities. Each category of women—married, divorced, never married, etc.—may have different fertility and family planning needs and should be explored and accounted for in programming.

### 2.3.3. Number of Live Births

Table 2.3 shows that across the cities, between 24 and 32 percent of women interviewed have never had children. This is likely related to the percentage of the sample that were young or who reported never having been married or in a union. The majority of women in the sample have had between one and three children and only 10 percent of women in Nairobi and 14 percent of women in Machakos have four or more children. In the other cities, the percentage of women with four or more children is closer to 20 percent, suggesting that Nairobi and Machakos (which is near Nairobi) may have lower fertility desires.

Among men, the percentage reporting not having any children is higher than for women (between 37 percent and 42 percent). About 40 percent of men in Nairobi, Mombasa and Kisumu have one to three children, while between 18 and 22 percent of men report having four or more children. Overall, men in Kisumu have more children than the men in the other two cities. The data therefore suggest that while men in Kisumu tend to marry later, they nonetheless have as many children as, and sometimes more than, men in the other cities surveyed.

## 2.4. Fertility and Planning Status of Last Births

This section provides information on current fertility by presenting the age-specific and total fertility rates in each of the five cities surveyed. This chapter also discusses fertility references and the prevalence of unwanted births by describing whether respondents who had been pregnant or given birth in the last two years had planned these pregnancies.

### 2.4.1. Current Fertility

Estimates on age-specific fertility rates (ASFR) and total fertility rates (TFR) by wealth for the five cities are given in Table 2.4A and 2.4B. The ASFR for a specific age group gives the number of births per 1,000 women; it is calculated by dividing the number of births to women in that age group during a period by the number of years lived by women in that age group during the same time period. The TFR is a summary measure based on the ASFRs that extrapolates the number of children a woman would bear during her reproductive years if she were to experience the ASFRs prevailing at the time of the survey.

As Table 2.4A shows, Kakamega has the highest overall TFR (4.1 births per woman), while Machakos has the lowest (2.5 births). The data on the ASFR show that the peak childbearing age across all the cities is 20 to 24 years, where the ASFR ranges from 138.3 births per 1,000 women in Machakos to 215.3 in Mombasa. These findings are not surprising because age and number of years during which a woman remains in formal education are related to her fertility.

There is considerable amount of early childbearing (between the ages of 15 and 19), with ASFRs ranging from a high of 148.7 births per 1,000 women in Kisumu to a low of 65.9 in Machakos for that young group. These data suggest a particular urgency for FP programming in Kisumu, especially among the younger age group.

Fertility falls uniformly across cities from the age of 30 years and tapers off in the oldest age group. A trend analysis of previous Kenya Demographic and Health Survey (KDHS) data starting in 1992 shows a fall in TFR in urban populations from 3.5 in 1993 to 2.9 in 2008–2009; the findings from this survey show that there is a great deal of variability in TFR values within this urban classification. The TFR of 2.8 for Nairobi here is consistent with the 2008–2009

KDHS for Nairobi (which is both a city and a province), while the urban populations of the other four areas surveyed have TFRs that are notably lower than the provinces in which they are located.

Table 2.4A: Age-specific and total fertility rates, by urban area, Tupange/MLE, Kenya, 2010					
	Nairobi	Mombasa	Kisumu	Machakos	Kakamega
Age-specific fertility rates per 1,000					
15–19	92.1	103.9	148.7	65.9	139.4
20–24	144.4	148.9	215.3	138.3	199.1
25–29	147.4	160.6	174.1	140.3	187.2
30–34	88.7	137.2	110.3	94.9	161.5
35–39	61.4	64.4	83.5	39.2	94.0
40–44	22.9	25.9	24.4	26.1	23.8
45–49	0.0	12.6	19.5	0.0	4.3
Total fertility rate	2.8	3.3	3.9	2.5	4.1

Table 2.4B: Total fertility rates by wealth index and urban area, Tupange/MLE, Kenya, 2010					
	Nairobi	Mombasa	Kisumu	Machakos	Kakamega
Total fertility rate by wealth index					
Poorest	3.2	4.4	4.0	3.0	5.4
Poor	3.1	3.8	4.7	2.8	4.6
Middle	3.3	4.4	4.6	2.5	3.7
Rich	2.7	2.4	2.9	2.0	3.4
Richest	1.7	2.3	3.2	2.4	3.1
Total fertility rate	2.8	3.3	3.9	2.5	4.1

As was the case in the 2008–2009 KDHS, an inverse relationship between household wealth and TFR was observed and is shown in Table 2.4B.

#### 2.4.2. Planning Status of Last Births

All women who had given birth since 2008 as well as women who were pregnant at the time of the survey were asked whether the last birth/current pregnancy was wanted at that time (i.e., planned), wanted at a later time (mistimed), or not wanted at all. Figure 2.2 shows the distribution of births since 2008, current pregnancies by urban area and the planning status of these births.

As illustrated in Figure 2.2, 27 to 40 percent of the last births since 2008 or current pregnancies were unplanned; that is, either the mother wanted a child later or wanted no more children at the time she became pregnant. Kisumu had the largest share of women (40 percent) with unplanned pregnancies. About 60 percent of the women with unplanned pregnancies in Kisumu wanted a child later, while 40 percent did not want more children (data not shown). Among the cities, Machakos had the largest share of women (73 percent) who wanted their pregnancies at the time the pregnancy occurred.

Figure 2.2: Planning status of last birth since 2008 by urban area

Of the five cities surveyed, Mombasa had the largest proportion of unplanned pregnancies, with nearly one out of every five births reported as unplanned. Machakos was the urban area with the lowest proportion reporting this to be the case, at only 5 percent. This again indicates a high need for family planning services for women in Kisumu and Machakos. Some variation was found across cities in the proportion of women who wanted a child later, ranging from a low of 7 percent in Mombasa to 23 percent in Kisumu which indicates the need for family planning in order to better space pregnancies.

# Chapter 3. Family Planning

---

As indicated in the KDHS, to attain a balance between resources and population, the Kenyan population policy promotes family planning as an entitlement that is based on informed and voluntary choice. Couples are motivated to adopt an FP method when they are offered improved access to and quality of reproductive health services. Adequate information about methods of contraception enables couples to develop a rational approach to planning their families. Therefore, a primary objective of this survey was to assess knowledge and use of contraceptive methods. This chapter describes women's knowledge, ever use and current use of contraceptive methods, as well as sources of modern methods, and intent regarding future contraceptive use. Also covered was knowledge of the fertile period, sources of FP methods, information provided to users, exposure to FP messages in the media (and elsewhere) and contraceptive myths. The type of information in this chapter was collected from all from five cities, from women aged 15–49 years old and men 15–54 years old.

## 3.1. Knowledge of Contraceptive Methods

Participating women and men were asked about their knowledge of various modern and traditional methods of family planning. To collect this information, a set of two questions was asked for each contraceptive method. First, respondents were asked to spontaneously mention all the methods of FP familiar to them. Then, for methods not mentioned spontaneously, the interviewer described the method and probed to see whether the respondent recognized it. Information was collected on knowledge about female and male sterilization, the pill, intrauterine devices (IUCDs), male condoms, female condoms, emergency contraception (EC) and “other modern methods” (diaphragms, foam or jelly, implants, lactational amenorrhea method [LAM]). Respondents were also asked about the Standard Days Method (SDM) and traditional methods.

Tables 3.1A and 3.1B show the percentage of women and men with knowledge of FP methods, by urban area. Knowledge (spontaneous and prompted) of any FP method was extremely high among both women and men. This is not surprising given the results of the 2008–2009 KDHS.

### 3.1.1. Women's Knowledge of Family Planning Methods

In general, women's spontaneous knowledge of each method was slightly lower than prompted knowledge. Spontaneous knowledge was highest for the pill, injectables and condoms, suggesting that Tupange may need to focus on increasing knowledge of long-term and permanent methods.

#### Modern methods

Almost all of the women in these five cities were aware of at least one method of family planning, more so for modern methods compared to traditional methods. Of these, the methods with which women were most familiar (spontaneous or prompted) were the pill (94 to 96 percent), the injectable (93 to 97 percent) and male condoms (97 to 98 percent). Several other modern methods were slightly less known but still highly recognized including the IUCD (78 to 87 percent), implants (79 to 87 percent) and female condoms (75 to 91 percent). Knowledge of female sterilization was lower, ranging from 63 percent in Nairobi to 84 percent in Machakos, and knowledge of male sterilization was also low (50 to 66 percent). Awareness of emergency contraception was lowest; only 45 percent of women in Mombasa were familiar with this form of contraception, and the highest proportion was 58 percent of the women in Nairobi.

## Natural and traditional methods

Across all the cities, awareness of LAM (38 to 55 percent) and traditional methods (57 to 64 percent) of contraception was lower than knowledge of most modern methods. It is interesting to note, however, that awareness of the SDM was relatively high in all cities, ranging from 78 percent in Kisumu to 88 percent in Machakos. This finding is particularly interesting given the very limited promotion and availability associated so far with this method.

Table 3.1A: Women's knowledge of contraceptive methods, by urban area, Tupange/MLE, Kenya, 2010 (percentage)

### 3.1.2. Men's Knowledge of Family Planning Methods

Unprompted knowledge of contraception among men, as was found among women, was lower than their probed knowledge. Spontaneous knowledge of any modern method was nearly universal, with between 91 percent (Nairobi) and 96 percent (Mombasa) being able to name a modern method. As expected, the male condom was the most frequently mentioned method.

### 3.2. Ever Use of Contraception and Method Mix

All women were asked if they had ever used a contraceptive method, and if so, which ones. The data on ever use of modern and traditional family planning methods were analyzed according to wealth quintile for the women interviewed, and the results for all cities are shown in Table 3.2. In all five cities, use of any method as well as use of any modern method was slightly higher for women in the poorest quintile than for women in the richest quintile. This finding appears somewhat unusual and may warrant additional analysis. In four of the five cities, the percentage of ever users of contraceptives did not vary greatly by wealth quintile. The exception was Mombasa, where use of any modern method ranged from a low of 53 percent in the richest quintile to 66 percent in the middle quintile.

Across all five cities, injectable contraception, the pill and male condoms had the highest ever use. Ever use of traditional methods was highest in Nairobi and Machakos.

**Table 3.2: Ever use of contraception among women 15–49, by urban area and wealth index, Tupange/MLE, Kenya, 2010 (percentage)**

### 3.3. Current Use of Contraception and Method Mix

#### 3.3.1. Women's Current Use

All women were asked if they were currently using a contraceptive method, and if so, which one. The data on current use (or non-use) of modern and traditional family planning methods were analyzed according to wealth quintile, and the results for all cities are shown in Table 3.3A. Overall, use by method is displayed for all women and women married or in union. In every urban area except Mombasa, the percentage of women using versus not using any method of contraception was almost evenly split. In Mombasa, two-thirds of women were not using any method of contraception. Use of modern methods was approximately 45 percent in four of the five cities, but only 29 percent in Mombasa, a finding suggesting that particular emphasis may be needed to analyze whether this is a result of demand, of issues related to service delivery, or of other factors. The percentage of all women relying on traditional methods ranged from 3 percent in Kakamega to 8 percent in Machakos.

**Table 3.3A: Percentage distribution of current use of contraception among women 15–49 by urban area and wealth index, Tupange/MLE, Kenya, 2010**

\*Other modern methods include dermal patch, diaphragm, spermicide and LAM.

Among traditional method users, there was little variation in use based on wealth. The most popular method across all cities and among all women and women married or in union was the injectable. Between 14 and 25 percent of all women and between 20 and 34 percent of married women use this method. The percentage reporting current use of injectable contraceptives was highest in Kakamega. The oral contraceptive pill was also popular, and this was true across cities surveyed. Pill use was commonly reported in Nairobi and Machakos, particularly among women in union. Finally, across all cities, the women in the richest wealth group are generally the most likely to use condoms as compared to the other wealth groups.

### 3.3.2. Men's Current Use

Male respondents were asked: "Which method(s) are you or your partner currently using?" The responses are displayed in Table 3.3B. Use of modern methods among all men and men in unions is above 50 percent in both Nairobi and Kisumu but somewhat lower in Mombasa. As with women, the most popular methods reported were male condoms and injectable contraception; however, a greater percentage of men reported use of traditional or natural methods.

**Table 3.3B: Percentage distribution of current use of contraception among men 15–59 by urban area, Tupange/MLE, Kenya, 2010**

Group	Any method	Any modern method	Modern Method								Other modern method*	Not currently using
			Female/male sterilization	Implant	IUCD	Injectables	Pills	Emergency contraceptive pill	Male condom	Any traditional method		
All men												
Nairobi	58.2	50.8	1.4	1.6	1.3	13.0	7.8	0.8	25.0	7.4	0.0	41.8
Mombasa	47.4	35.6	0.1	1.6	0.4	10.6	4.5	0.0	18.3	11.8	0.1	52.6

Kisumu	62.3	52.0	3.6	4.0	1.6	20.0	7.7	0.5	14.7	10.3	0.0	37.7

\* Other modern methods include female condom, diaphragm, spermicide and LAM

### 3.4. Knowledge of Fertile Period

Women and men were also asked, “From one menstrual cycle to the next, are there certain days when a woman is more likely to get pregnant if she has sex?” If a man or woman answered yes, they were asked if a woman is most likely to become pregnant just before her period begins, during her period, right after her period has ended, halfway between the two periods (the most accurate answer) or some other time. The results are presented in Table 3.4, and show that the percentage of women with knowledge of the correct answer to this question ranged from 22 percent in Kisumu to 33 percent in Kakamega and Nairobi. In several cities, women were more likely to answer that their most fertile period was immediately following menses. The percentage of men with knowledge of the correct answer ranged from 13.5 percent in Mombasa to 22.1 percent in Kisumu (not shown). None of the cities had a majority of men giving the correct response. It is clear from these data (and from data in the KDHS) that basic knowledge of reproductive physiology remains low.

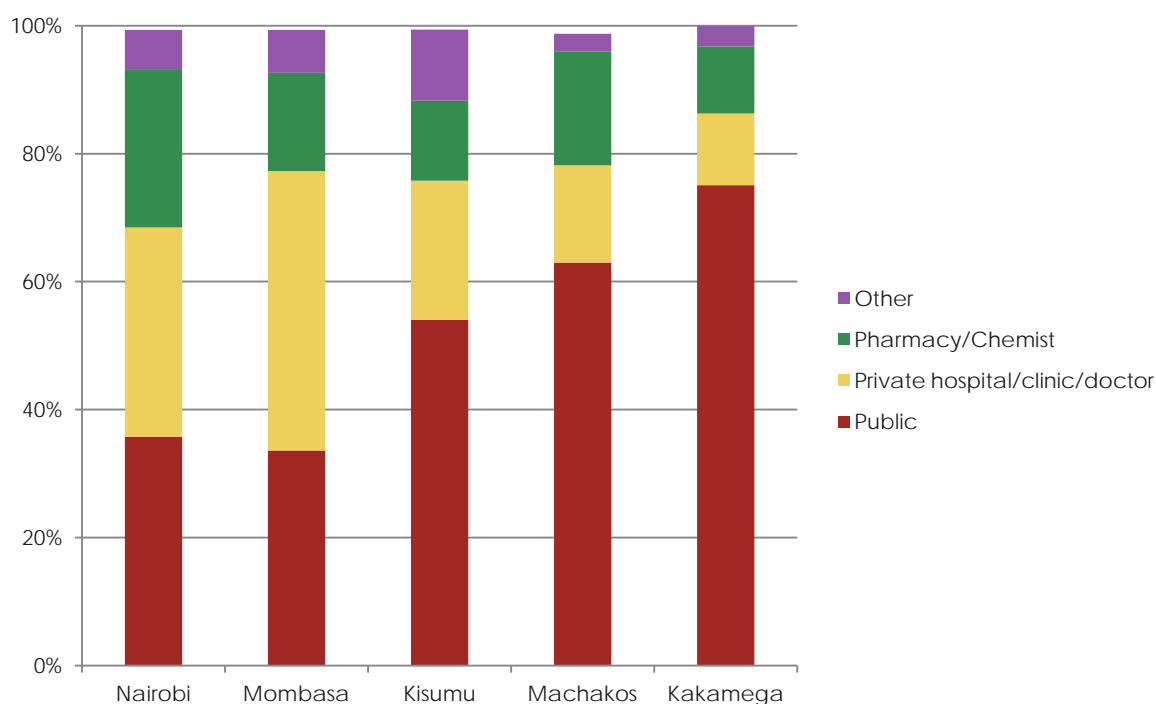

Table 3.4: Knowledge of fertile period by urban area, Tupange/MLE, Kenya, 2010					
Women					
Perceived fertile period	Nairobi	Mombasa	Kisumu	Machakos	Kakamega
Just before her period begins	18.0	18.3	20.7	23.5	20.8
During her period	1.8	4.7	2.1	3.2	2.4
Right after it ends	27.5	26.1	37.0	30.5	24.4
Halfway between two periods	32.7	23.8	21.5	24.9	33.1
Other	0.5	0.5	0.7	0.2	1.0
Don't know/Missing	19.5	26.6	18.0	17.6	18.4
Total	100.0	100.0	100.0	100.0	100.0

### 3.5. Source of Current Modern Contraception Methods

All women who reported current use of a modern method of family planning were asked the source where they obtained their method most recently. Responses were grouped as public facilities, private facilities<sup>5</sup> and pharmacies/chemists. Figure 3.1 provides information on the percentage of women who received their current method from each of these sources.

<sup>5</sup> This includes nongovernmental organizations (NGOs) and faith-based organizations (FBOs).

**Figure 3.1: Source of current modern contraceptive method among women users, by facility type, for five cities**

Public health facilities were the source of FP for the majority of women in Kisumu, Machakos and Kakamega, and were the source for more than a third of women in Nairobi and Mombasa. Clients of private hospitals/clinics/doctors ranged from 15 percent in Machakos to 44 percent in Mombasa. Whether these differences among cities are related to access or to preferences cannot be determined by the data in this survey, but may be worth investigating further. The pharmacy or chemist was a less common source of contraceptives for women in all cities, ranging from 11 percent in Kakamega to 25 percent in Nairobi. Other sources included shops, kiosks, worksite clinics, voluntary counseling and testing (VCT) centers, etc., but these accounted for a small percentage of sources for modern contraception.

### 3.6. Informed Choice

Women who reported current use of the methods of modern contraception were asked if they were informed about possible side effects of their chosen method and were also asked if a health care worker provided information on alternative method choices. These results are presented in Tables 3.6A and 3.6B.

Method	Nairobi	Mombasa	Kisumu	Machakos	Kakamega
Injectables	52.4	60.8	76.0	68.4	67.1
Daily pill	45.7	59.8	72.5	65.3	54.5
Condoms	21.1	20.0	22.0	11.4	18.4
Implants	63.8	65.8	86.1	68.5	66.6
IUCD	81.7	79.0	78.5	83.6	82.6
Other modern	28.4	38.4	48.8	46.1	47.4

**Table 3.6B: Percentage who were informed by a health or family planning worker of other methods that could be used, by method and urban area, Tupange/MLE, Kenya, 2010**

Method	Nairobi	Mombasa	Kisumu	Machakos	Kakamega
Injectables	68.3	72.1	79.7	82.7	83.3
Daily pill	68.7	85.5	79.9	81.4	71.3
Condoms	41.4	51.6	37.9	44.8	52.5
Implants	85.5	82.1	83.4	91.9	83.3
IUCD	92.9	72.0	92.8	96.5	93.0
Other modern	60.5	60.3	64.4	72.4	72.5

Users of intrauterine devices were most often provided information on side effects and informed of other methods—close to 80 percent in all urban areas. In contrast, only 20 percent of women using condoms were offered information on side effects. This last fact may not be of concern in light of the limited side effects of condoms.

For users of injectable contraceptives, pills and implants, the proportion of women informed about the possible side effects of their current method ranged from about half of women in Nairobi to around three-quarters of women in Kisumu. Since fear of side effects remains a major reason for contraceptive non-use and discontinuation, it is important to ensure that the intervention looks at ways to address this issue through improved service delivery and expanded behavior change communication using key messages.

The percentage of women offered information on other methods ranged from 68 to 83 percent for those choosing the injectable, 69 to 86 percent for the pill, 82 to 92 percent for implants and 72 to 97 percent for the IUCD. These findings suggest that women are receiving information on important issues such as side effects and method choice but there is still room for improvement on the information provided to users of modern family planning.

### 3.7. Exposure to Family Planning Messages

This section provides information on women’s exposure to family planning messages or information through radio, television and newspaper. As can be seen in Table 3.7A, the majority of women in all five cities reported hearing FP messages in the last three months on the radio, ranging from 56 percent in Mombasa to 73 percent in Kisumu. A slightly lower percentage of women had been exposed in the last three months to FP messages via television, with 41 percent in Kakamega and 53 percent in Kisumu reportedly seeing FP messages on television. Newspaper was a much less likely source of information on FP, yet still provided messages to a sizable percentage of the population, ranging from 22 percent in Mombasa to 33 percent in Machakos.

**Table 3.7A: Women's exposure to FP messages, by source and urban area, women aged 15–49, Tupange/MLE, Kenya, 2010**

Media Source	Nairobi	Mombasa	Kisumu	Machakos	Kakamega
Radio	57.9	56.3	72.5	71.7	67.8
Television	50.4	52.5	47.7	43.6	41.1
Newspaper	25.0	21.6	24.2	33.3	24.4
None of these	27.6	25.7	17.0	17.3	20.9

**Table 3.7B: Men's exposure to FP messages, by source and urban area, men aged 15–59, Tupange/MLE, Kenya, 2010**

Media Source	Nairobi	Mombasa	Kisumu
Radio	73.5	76.8	81.8
Television	61.4	59.6	62.4
Newspaper	49.8	44.4	46.7
None of these	14.8	11.2	9.4

Between 17 and 26 percent of women reported no exposure to family planning messages in the last three months via any of these three media. In all cities, men were more likely to have been exposed to an FP method in all three types of media and fewer men reported no exposure to any messages than did women. This could be related to men's overall higher consumption of media (see Chapter 6).

### 3.8. Contraceptive Myths

Incorrect information about contraception is often prevalent and can influence rates of contraceptive use. All respondents with knowledge of at least one contraceptive method were asked a series of questions relating to beliefs around family planning use. Respondents were asked whether they strongly agreed, agreed, disagreed or strongly disagreed with the statements listed in Tables 3.8A (for women) and 3.8B (for men). For simplicity of display, only the percentage of users who agreed or strongly agreed is displayed. The wording of the myths was slightly different for the women's and men's questionnaires and is therefore different on the tables.

The results show high levels of misinformation around family planning use in all cities. For example, in Kakamega 57 percent of women surveyed believe that use of a contraceptive injection could make a woman permanently infertile. A majority of female respondents in all five cities believed seven out of the eight myths presented. Regarding the association between contraception and female promiscuity (women who use may become promiscuous), between 18 percent (Kisumu) and 41 percent (Machakos) of women believed the statement to be true. Our data clearly suggest that misinformation remains common and that correcting this misinformation should be seen as a priority for program planners.

**Table 3.8A: Percentage of women age 15–49 who agreed with the following statements regarding FP by urban area, Tupange/MLE, Kenya, 2010**

Statement	Nairobi	Mombasa	Kisumu	Machakos	Kakamega
Can make a woman permanently infertile	53.7	54.1	39.3	46.1	57.2
Users end up with health problems	75.4	77.5	73.6	82.5	78.6
Can harm your womb	62.4	71.9	53.1	63.4	70.1
Reduce women's sexual urge	63.1	55.9	59.0	48.4	57.7
Can cause cancer	55.6	68.2	40.8	70.6	60.8
Can give you deformed babies	63.9	63.3	62.6	61.1	66.8
Are dangerous to your health	72.8	76.9	64.2	82.5	70.9
Women who use may become promiscuous	38.1	32.0	18.0	41.2	23.6

**Table 3.8B: Percentage of men age 15–59 who agreed with the following statements regarding FP, by urban area, Tupange/MLE, Kenya, 2010**

Statement	Nairobi	Mombasa	Kisumu
Can make a woman permanently infertile	51.2	58.8	47.8
Users end up with health problems	69.8	81.8	73.1
Reduce women's sexual urge	64.2	59.1	50.8
Can cause cancer	49.4	67.7	40.6
Can give you deformed babies	57.3	70.1	66.3
Are dangerous to women's health	65.3	83.5	63.0
Is a woman's business and a man should not have to worry about it	17.3	10.9	13.6
Women who use may become promiscuous	40.9	39.8	41.0
Using a male condom reduces a woman's sexual pleasure	51.3	59.6	36.6
Using a male condom reduces a man's sexual pleasure	56.5	65.6	43.9
Using a condom is a sign of cheating	23.8	40.4	23.2

Men were asked a slightly different set of questions than women, with the addition of questions about condom use. The survey found that men are also subject to misinformation regarding contraceptive use (as shown in Table 3.8B), and in light of their role as “gatekeepers,” they can influence contraceptive use among women and youth. This finding suggests that attention to reducing the levels of misinformation is warranted. Surprisingly, a very small percentage (the highest was 17 percent in Nairobi) of men agreed with the statement “family planning/contraception is a woman’s business and a man should not have to worry about it.” Like women, a majority of men believe common myths about contraception. These are important beliefs that need to be changed before people may adopt FP methods. Men’s beliefs about condoms indicate that in Nairobi and Mombasa, the majority of men believe that using a condom reduces both a woman’s and a man’s sexual pleasure; the percentage agreeing with this belief in Kisumu was lower. This last finding is of interest as it may be that years of focused HIV campaigns are partly responsible for this, thus indicating that it may be possible to change overall beliefs and norms on condom use. In Mombasa, 40 percent of men believe that using a condom is a sign of cheating. In Nairobi and Kisumu the percentage reporting this belief is lower at about 23 percent.

### 3.9. Future Intention to Use Contraception

Women and men who were not using contraception at the time of the survey were asked about their intentions to use a family planning method in the next 12 months. Table 3.9A shows the intention to use contraception across the five cities among women.

**Table 3.9A: Percentage distribution of women not currently using contraception and who know at least one FP method, based on their intention to use in the future, by urban area, Tupange/MLE, Kenya, 2010**

Women					
Urban area	Future intention to use contraception (in percentage)				Number of women not using
	Intends to use FP in the next 12 months	Does not intend to use in next 12 months	Does not know	Missing	
Nairobi	29.6	60.6	8.8	1.0	1,322
Mombasa	18.4	67.9	13.5	0.3	907
Kisumu	34.4	54.7	10.3	0.6	778
Machakos	28.2	64.6	6.2	1.0	805
Kakamega	32.2	58.2	9.1	0.6	629

The majority of women in all five cities not currently using contraception reported no intention of initiating family planning use in the next 12 months. Across all the cities, the proportion of women who did not intend to use contraception was substantially higher than the proportion of women who intended to use FP in the next 12 months. The percentage intending to use ranged from 18 percent in Mombasa to 34 percent in Kisumu. It is worth noting that a large proportion of women report that they do not know if they will use a method in the next 12 months. Some of these women are likely to adopt a method in the next year.

**Table 3.9B: Percentage distribution of men not currently using contraception and who know at least one FP method, based on their intention to use in the future, by urban area, Tupange/MLE, Kenya, 2010**

Men					
Urban area	Future intention to use contraception (in percentage)				Number of men not using
	Intends to use FP in the next 12 months	Does not intend to use in next 12 months	Does not know	Missing	
Nairobi	27.9	53.2	17.4	1.5	481
Mombasa	18.7	66.0	15.3	0.0	309
Kisumu	29.3	61.5	9.3	0.0	216

The responses to the same question for male non-users are displayed in Table 3.9B. Between 19 and 29 percent of men report that they intend to use a method in the next 12 months. Like women, the majority of men report that they don't know if they will use a method in the next 12 months.

### 3.10. Future Use of Contraception and Reasons for Non-Use

#### 3.10.1. Future Intention to Use

An important indicator of the changing demand for family planning is the extent to which non-users of contraception plan to use FP in the future. Table 3.10A demonstrates future contraceptive preferences among women, disaggregated by method preferred. In every urban area, women who stated an intention to use contraception in the future most often reported an intention to use injectable contraception. This is not surprising because the injectable is the most common method used in the study cities (and as per the KDHS, nationwide). Other methods commonly named for future use include the pill and the male condom. Men gave similar responses in Table 3.10B, with condoms and the injectable being the methods most commonly cited as those to be used in future.

**Table 3.10A: Percentage distribution of women age 15–49 who are not using a family planning method who intend to use in the future, by preferred method and urban area, Tupange/MLE, Kenya, 2010**

### 3.10.2. Reasons for Non-Use

Respondents were asked to give their reasons for not currently using a family planning method at the time of the survey. This information is crucial for understanding obstacles to contraceptive use, so that programs can be designed either to increase demand or to meet unmet need.

Reasons for non-use among women and men who were currently not using any FP method are presented in Tables 3.10C (for women) and 3.10D (for men). Respondents were asked, “why are you not currently using a method of family planning?” and were told they could offer as many reasons as they wanted, so the percentages displayed represent the percentage of women or men who gave each reason and do not add up to 100.

**Table 3.10C: Percentage distribution of reasons for non-use of contraception among women, by urban area, Tupange/MLE, Kenya, 2010**

Others	1.0	1.2	0.0

No large variations among cities were reported in the reasons given by women for not using contraception. The most commonly mentioned reason was infrequent or no sex: this was stated by between 39 and 60 percent of women in all cities. A much lower percentage of women (9 to 13 percent) were non-users because they were trying to get pregnant. Between 10 and 12 percent of the women were pregnant at the time of survey and therefore not using a method.

Fear of side effects is a reason for non-use commonly cited in FP literature. Within this sample of non-using women, fear of side-effects was mentioned among 10 to 16 percent of women. Very few women reported non-use due to partner or religious opposition or because of lack of knowledge of methods or method sources. Financial and geographic access was mentioned less than 1 percent of the time in all cities. Reasons for non-use given by male respondents were similar to those given by women, with infrequent/no sex being the most popular. Between 10 and 14 percent of men reported that they wanted more children as their reason for not using a method. Lack of access and cost of the method were mentioned in less than 1 percent of the cases for men as well. The findings from this survey therefore suggest that fear of side effects needs to be addressed (as does meeting unmet need) while increasing overall demand, except in

specific groups, such as young people and men in Mombasa, may not be the most immediate program priority.

### **3.11. Attitudes about Family Planning**

#### **3.11.1. Attitudes about Access and Use of Family Planning**

Women were asked if they strongly agreed, agreed, disagreed or strongly disagreed with a series of statements regarding access and use of family planning methods (Table 3.11). Women almost universally agreed that they could get to a source of contraception and could obtain a method should they decide to use one. There was no significant difference by wealth group. Regardless of urban area of residence, a large majority of women surveyed said that even if her friends or neighbors did not use contraception or if her religious leader did not approve, she could use a method of contraception (range 82 to 96 percent). Women in Mombasa were most likely to say that such concerns could deter them from use (Table 3.11).

Also reported in Table 3.11 is that very few women—between 4 percent (Machakos) and 13 percent (Mombasa)—reported that they could continue using an FP method after experiencing problems with that method. This suggests that knowing about possible side effects in advance, and knowing when these are dangerous or serious, is important to women and may be an important component of interventions to improve the quality of service delivery.

Table 3.11: Percentage of women who agree or strongly agree with statements regarding accessing and using FP, by urban area and wealth, Tupange/MLE, Kenya, 2010					
Urban area/ Wealth index	Can get to a place where FP methods are sold/offered if she decided to use one	Could obtain FP method if she decided to use one	Could use FP method even if none of her friends/neighbors uses	Could use FP method even if religious leader did not think she should use	Could continue using FP method even after experiencing some side effects

### 3.11.2. Attitudes and Beliefs about Family Planning Service Delivery

All women respondents were asked about their attitudes toward family planning service delivery (Table 3.11B). Taken as a proxy for satisfaction (among ever-users) and perceptions (among never-users) of quality, the data suggest that quality of service delivery appears to be high (i.e., few respondents agreed with the statements) in all cities and not dependent on a women's socioeconomic status. The largest variation came in response to the statement "women don't like the way they are treated in family planning clinics around here," where only 9 percent of women in Kisumu agreed compared with 25 percent in Nairobi. Even the lowest figure of 9 percent of women stating dissatisfaction is too high, and certainly 25 percent (one in four) respondents being unhappy with service is not acceptable.

No questions were asked about waiting times (particularly at public sites), and some other studies in Kenya have found this to be an issue rather than the treatment that clients get when they are finally seen.

The data are not available by age group, which might have provided useful information regarding how youth are (or expect to be treated) by health care workers. This may be an interesting issue to investigate in the future.

# Chapter 4. Sexual Activity

This chapter presents information on sexual activity, collected from women ages 15–49 years and men ages 15–59 years. The topics covered in this chapter include recent sexual activity and age at first sexual intercourse.

## 4.1. Recent Sexual Activity

Respondents answered a series of questions on their sexual histories, starting with age at first intercourse, and those who ever had sexual intercourse were asked when was the last time they had sexual intercourse. As can be seen in Tables 4.1A (for women) and 4.1B (for men), the responses were grouped as: within the last four weeks, the last year and more than one year. For comparison, we added the women who had never had sex. These categories are exclusive to each other, so represent the entire sample of women. The majority of women interviewed (approximately 60 percent in each urban area) reported engaging in sexual intercourse within the last four weeks, while close to one-fifth reported sexual intercourse in the last year. Very few women—approximately 7 percent in each urban area—reported that it has been more than a year since they had sex, while between 9 percent (in Kisumu) and 18 percent (in Mombasa) reported never having sex. Men reported very similar rates across all categories, with a lower proportion reporting that they never had

**Table 4.1A: Timing of last sexual intercourse, by urban area, Tupange/MLE, Kenya, 2010**

Women					
Timing of last sexual intercourse	Nairobi	Mombasa	Kisumu	Machakos	Kakamega

Missing	0.8	1.2	0.2

## 4.2. Age at First Sexual Intercourse

Table 4.2A shows the percentage distribution of first sex among women by age and wealth quintile for the five cities. For all cities and wealth quintiles, a majority of women had engaged in sex by 20 years of age. Sexual debut occurred earlier in the poorer wealth quintile regardless of urban area of origin, an important finding that might suggest a combination of factors being at play, including transactional sex, lack of opportunity, poverty and a lack of hope that any aspirations might be achieved. In Kisumu, 77 percent of women in the poorest wealth quintile had engaged in intercourse by age 17, compared with only 36 percent in the richest wealth quintile. Nairobi saw a similar disparity, with 47 percent of women in the poorest wealth quintile experiencing sexual debut by the age of 17 compared with 21 percent of the richest. In Mombasa, while only 6 percent of women in the richest quintile reported having had sex when younger than 15, 23 percent of the poorest had. This trend was similar across all five cities.

Overall	26.9	41.5	24.3	4.2	1.3	1.2	0.6

Data collected from men (see Table 4.2B) show a similar pattern. The trend shows a greater proportion of men in the poorer quintiles having earlier sexual debut although the differences found are not as pronounced as were found among women. For example, 64 percent of the poorest men in Nairobi had their first sexual experience by the age of 17 compared to 49 percent of the richest. In Kisumu, which had the greatest disparity between the wealth quintiles for women, 75 percent of the poorest men had had sex by 17 compared to 51 percent of the richest.

### 4.3. Fertility Preferences

This section presents information from the five cities on fertility preferences, collected from women aged 15–49 years and men aged 15–59 years. To obtain this information, all non-pregnant women surveyed were asked if they would like to have (a/another) child or would prefer not to have any (more) children. Pregnant women were asked if they would like to have another child or prefer not to have any more children after delivering the one they were carrying. Women who expressed a desire for additional children were asked how long they would like to wait before the birth of their next child. Men between the ages of 15 and 59 years were also asked these questions. The findings are presented in Tables 4.3A (women) and Table 4.3B (men). These data give an indication of demand for FP services that could be addressed through demand generation activities.

Data on the unmet need for family planning methods indicate the gap between demand for and use of family planning services. The unmet need for spacing relates to women who want to space

or limit births but are not currently using a method of contraception. In this group are fecund, sexually active women who are not pregnant, and are not using any method of family planning but want to wait two or more years for their next birth as well as currently pregnant women whose pregnancy was reported as mistimed. Unmet need for limiting refers to women who want to limit their childbearing. Also included are fecund, sexually active women who are not pregnant, and are not using any method of family planning, but want no more children, as well as currently pregnant women whose pregnancy was unwanted. Data on unmet need for spacing and limiting by wealth quintiles and marital status are given in Table 4.4 for all five study cities.

Table 4.3A: Percentage distribution of fertility preferences among women, by urban area, Tupange/MLE, Kenya, 2010					
Women					
Desire for children	Nairobi	Mombasa	Kisumu	Machakos	Kakamega
Wants another soon (<2 years)	13.5	14.2	11.9	10.4	12.8
Wants another later (2+ years)	38.2	30.8	40.1	30.7	38.6
Wants after marriage	4.4	11.7	5.9	12.1	2.8
Wants another, undecided when	7.8	10.2	5.0	5.8	6.9
Want no more	33.2	29.1	32.7	36.3	33.2
Infecund	2.7	3.1	4.1	4.6	5.6
Don't know/Missing	0.2	0.9	0.2	0.0	0.0
Total	100.0	100.0	100.0	100.0	100.0
Number of women	2,706	1,465	1,603	1,834	1,324

About 30 percent of the women across the cities said that they did not want any (more) children (range 29 to 36 percent). Roughly two-thirds of the women in each urban area said they would like to have a/another child at some time, although more women (between 30 to 40 percent) preferred that such a birth occur in two or more years rather than within two years (around 10 percent). Women in Mombasa were most likely (14 percent) to report wanting a/another child within two years' time, and women in Kisumu were the most likely to express (40 percent) wanting a child after two years.

Between 5 and 10 percent of women wanted (more) children but were undecided when. In Mombasa and Machakos, about 12 percent of women reported that they wanted a child but only after marriage. Approximately 5 percent of women reported being infecund.

Table 4.3B: Percentage distribution of fertility preferences among men, by urban area, Tupange/MLE, Kenya, 2010			
Men			
Desire for children	Nairobi	Mombasa	Kisumu
Wants another soon (<2 years)	21.5	19.7	18.5
Wants another later (2+ years)	37.7	37.1	38.8
Wants after marriage	8.2	9.6	14.4
Wants another, undecided when	5.7	4.6	4.8
Want no more	26.3	25.8	22.4
Sterilized/Infecund	0.1	2.7	1.0
Don't know/Missing	0.5	0.6	0.2
Total	100.0	100.0	100.0

Table 4.3B shows male respondents' responses to the same question. A large proportion of men (between 22 and 26 percent) said they did not want any more children. Between 45 and 50 percent of the men in each urban area wanted another child, but like the women, the majority

wanted to postpone the (next) birth for at least two years. Approximately 20 percent wanted a child within two years and between 8 and 14 percent wanted a child after marriage.

**Figure 4.1: Fertility preferences for women and men in five cities**

#### 4.4. Unmet Need

As described earlier in this section, unmet need for family planning methods indicates the existence of a gap between demand for and use of FP services. Data on unmet need for spacing and limiting by wealth quintiles and marital status are given in Table 4.4 for all five study cities.

Table 4.4: Unmet need* for FP among married 15–49 and among unmarried, sexually active women 15–49, by urban area and wealth index, Tupange/MLE, Kenya, 2010						
Urban area / Wealth index	Currently Married Women				Unmarried Sexually Active**	
	No unmet need	For spacing	For limiting	Total unmet need	No unmet need	Total unmet need (space or limit)
<b>Nairobi</b>						
Poorest	67.5	16.8	15.7	32.6	50.9	49.1
Poor	72.3	19.2	8.5	27.7	67.0	33.0

<b>Machakos</b>						
Poorest	80.0	7.8	12.2	20.0	66.1	33.9
Poor	86.9	4.8	8.3	13.1	76.2	23.8
Middle	82.6	9.4	8.0	17.4	60.2	39.8
Rich	79.4	10.8	9.8	20.6	65.5	34.5
Richest	80.1	9.4	10.5	19.9	61.9	38.1
<b>Kakamega</b>						
Poorest	69.9	16.2	13.9	30.1	52.9	47.1
Poor	76.5	14.9	8.6	23.5	51.3	48.7
Middle	72.2	15.5	12.3	27.9	77.7	22.3
Rich	75.8	14.6	9.6	24.2	61.4	38.6
Richest	73.6	12.9	13.6	26.4	47.6	52.5

\*Unmet need for spacing includes pregnant women whose pregnancy was mistimed; and fecund women who are non-pregnant, who are not using any method of family planning, and say they want to wait two or more years for their next birth. Unmet need for limiting refers to pregnant women whose pregnancy was unwanted; and fecund women who are non-pregnant, who are not using any method of family planning, and who want no more children. Excluded from the unmet need category are pregnant women who became pregnant while using a method (these women are in need of a better method of contraception).

\*\*Sexually active - had sex in the last year (n's small for this group).

Table 4.4 shows that among the five cities, unmet need for currently married women ranged from a low of 18 percent in the richest quintile in Nairobi to a high of 41 percent in the poorest quintile in Mombasa. These figures were much greater for unmarried, sexually active women, suggesting that these women are not getting the services they want and need. Among unmarried sexually active women, unmet need ranged from a low of 22 percent in the middle quintile in Nairobi to a high of 79 percent in the poorest quintile in Mombasa, however the number of observations in these groups is small.

With few exceptions, among currently married women, the unmet need for a spacing method is greater across all cities and wealth quintiles than the unmet need for limiting births. On average, among all women who reported an unmet need for an FP method, more women felt a need to space than limit future births. Analysis of the data on total unmet need among currently married women by wealth quintiles showed that unmet need tended to fall as income rose in Nairobi, Mombasa and Kisumu. This meant that the poorest quintile tended to have the largest proportion of women reporting an unmet need for family planning, and this proportion declined as wealth increased. In the remaining two cities, however, this pattern was not observed.

# Chapter 5. Maternal and Child Health

This chapter contains information on indicators related to maternal and child health (MCH) collected from women who had at least one birth since 2008. Findings relating to place of delivery and infant and child mortality in the five cities are also presented in this chapter.

## 5.1. Place of Delivery

Women in the five cities surveyed were asked about the place of delivery for the youngest child to whom she had given birth since 2008. As presented in Figure 5.1, public facilities were the most commonly cited place of birth for women in all cities, ranging from 41 percent in Mombasa to 56 percent in Kakamega. Although used less often than public facilities, private facilities were still commonly used by many women, ranging from 17 percent in Kakamega to 44 percent in Nairobi. In Nairobi, less than 10 percent of women gave birth at home. In comparison, more than one in four women in Kakamega had a home birth. Whether this difference is due to access to services or other factors cannot be inferred from our data.

Figure 5.1: Place of delivery for women who have given birth since 2008, in five cities

## 5.2. Assistance during Delivery

The type of assistance women receive during delivery is an important determinant of the birth outcome, including the health and survival of the mother and infant. While most antenatal services can be effectively delivered by a midwife, nurse or similarly skilled health professional, safe deliveries require skilled attendance (as well as equipment and supplies). The skills and performance of the birth attendant determine whether or not he or she can manage complications and observe hygienic practices. For complicated cases, it may be necessary to draw upon more specialized skills (WHO, 2003).

**Table 5.2: Percentage distribution of women who have given birth since 2008, by type of assistance during delivery and urban area, Tupange/MLE, Kenya, 2010–2011\***

Type of assistance during delivery	Nairobi	Mombasa	Kisumu	Machakos	Kakamega	All Cities
Doctor/Clinical officer	59.1	47.5	43.4	55.4	44.9	55.5
Nurse/Midwife	30.6	28.4	32.2	24.7	29.9	30.2
TBA	2.0	7.8	14.7	9.5	8.1	4.2
Community health worker	1.1	0.6	3.1	0.7	1.5	1.1
Friend or relative	4.0	10.9	2.5	6.3	6.5	5.3
Other	1.3	1.7	0.9	0.3	1.4	1.4
No one	1.1	1.3	2.8	1.8	7.3	1.4
Missing	0.8	1.9	0.4	1.2	0.4	1.0
Number of women with a birth since 2008*	825	463	597	447	509	2,841

\* Some women gave multiple responses; in such cases, we took the "most qualified" health provider mentioned as the primary source of delivery care service.

Table 5.2 presents the percentage distribution of women who have given birth since 2008 by type of attendant. Across the five study sites, the majority of births were assisted by skilled health workers (doctor/clinical officer and nurse/midwife), ranging from about 75 percent in Mombasa, Kisumu and Kakamega to 90 percent in Nairobi. Noticeably, the proportion of births delivered by traditional birth attendants (TBAs) remains high in Kisumu, at nearly 15 percent, and in Mombasa, almost 11 percent of respondents reported being delivered by a friend or relative. This suggests that improvements are still needed in ensuring that women in Kenya receive skilled care at birth; our findings reinforce those reported in the most recent KDHS. The increasing maternal mortality ratio noted in Chapter 1 shows that much remains to be done on the safe motherhood front.

### 5.3. Integration of FP Services with MCH and HIV Services

The issue of integration of FP services with MCH and HIV/AIDS services is becoming an increasingly high priority among national reproductive health programs, donors and development partners. This is premised on the view that these services have similar characteristics, target populations and desired outcomes, and share common needs and concerns. Indeed, a review of the literature on linking reproductive health and HIV services found that integration led to increased access to and uptake of services including use of modern contraceptives, increased HIV testing and condom use, and improvements in overall quality of services (USAID, 2011; Ringheim et al., 2009).

To provide a basis for the assessment of the level of integration, the MLE survey collected data on information or counseling on family planning received by women during their most recent visits to MCH services and HIV testing, or while purchasing or obtaining medicine from a pharmacy. The results are presented in Tables 5.3A (last maternal health visit), 5.3B (time of delivery), 5.3C (last child health visit), 5.3D (last child vaccination visit), 5.3E (last HIV test) and 5.3F (preferred pharmacy).

Table 5.3A shows that the proportion of women who received FP counseling or information at the time of their last maternal health visit was 73 percent in Machakos, around 62 to 64 percent in Nairobi, Mombasa and Kisumu, and 56 percent in Kakamega. Across the study sites, a low proportion of women received an FP method during the last maternal health services visit (from 4 percent in Mombasa to 10 percent in Nairobi).

In Table 5.3B, the proportion of women who reported receiving FP counseling or information just before and/or after delivery was highest in Kakamega (73 percent) and Machakos (69 percent), followed by Nairobi (60 percent). Across the sites, the likelihood of receiving FP counseling or information was higher after delivery (with proportion varying from 37 percent in Mombasa to 56 percent in Machakos) than before delivery (proportions between 4 and 12 percent) or at both before and after delivery (proportion between 4 and 8 percent). These numbers are however all quite low and suggest missed opportunities and an area on which the project could focus to expedite some quick wins and impact.

Comparing Table 5.3A and 5.3C, it is apparent that the pattern that emerged across all five cities was that child health services tend to be more “integrated” with FP services than were maternal health services. This is gap that needs significant attention and intervention. Offering routine postpartum family planning might be a way for urban populations to see better health.

Table 5.3A: Percentage of women* aged 15–49 receiving FP counseling or information at time of last maternal health visit, by service received and urban area, Tupange/MLE, Kenya, 2010						
Type of information / counseling received	Nairobi	Mombasa	Kisumu	Machakos	Kakamega	Number of Women

Number of women	1,298	588	940	643	642	4,112

**Table 5.3F: Among women age 15–49 who have a specific pharmacy from which they usually purchase medicines, the percentage who have EVER received information or counseling on FP from their preferred pharmacy, by urban area, Tupange/MLE, Kenya, 2010**

Age	Nairobi	Mombasa	Kisumu	Machakos	Kakamega	Number of Women*
15–19	5.3	7.8	3.9	2.6	2.1	1,244
20–24	9.5	10.7	4.9	3.7	3.9	2,439
25–29	14.0	14.1	7.9	6.9	7.1	2,007
30–34	13.8	13.2	7.3	8.2	4.6	1,297
35–39	13.7	13.2	2.8	5.9	4.2	875
40–44	9.5	15.9	5.2	5.7	0.7	624
45–49	11.5	9.4	3.8	4.6	3.5	446
Total	11.4	11.9	5.5	5.4	4.2	8,932

The proportion of women who received FP counseling/information at time of last child health visit is highest at 82 percent in Machakos, lowest at 69 percent in Kakamega and stands between 74 and 79 percent in the three other sites. As for the last maternal health visit, the proportion of women who received a method during the last child health visit is low. While the proportion of women who received FP counseling/information at time of last child vaccination, compared to during the last maternal and child health visit (see Tables 5.3A and 5.3D) is higher, the proportion of women who received a method of FP is also higher, standing at 19 percent in Nairobi and Kisumu, and 15 percent and 17 percent in Machakos and Kakamega, respectively.

Table 5.3E reports an overall high proportion of women receiving FP counseling/information at time of their last HIV test, ranging from 71 percent in Kisumu and Kakamega to 84 percent in Machakos. Finally, Table 5.3F shows a low proportion (between 4 percent and 12 percent) of women who have ever received information/counseling on FP/birth spacing from their preferred pharmacy, with highest proportions recorded in the age group 25–39 in most study sites.

#### 5.4. Neonatal, Infant and Child Mortality

Table 5.4 displays the neonatal, infant and under-five mortality rates. As can be seen, neonatal mortality rates across the five cities is around 23–26 per 1,000 live births except in Machakos (30 per 1,000 live births). The data suggest that neonatal mortality is lower in the study sites compared to overall urban Kenya as reported in the 2008/09 DHS (32 per 1,000 live births).

This was also found to be the case, with infant mortality and under-five mortality rates also lower in the study sites, compared to overall urban Kenya.

**Table 5.4: Mortality rates, by urban area, Tupange/MLE, Kenya, 2010–2011**

Rate	Nairobi	Mombasa	Kisumu	Machakos	Kakamega
Neonatal mortality rate	25.5	23.7	23.2	30.0	23.6
Infant mortality rate	44.2	41.5	49.6	48.1	52.2
Under-5 mortality rate	46.7	48.6	59.7	49.9	54.8

# Chapter 6. Decision-Making and Women's Empowerment

This chapter presents data on communication between spouses regarding fertility preferences and the decision to use family planning. Spousal communication on the use of contraception and number of preferred children is often used as a proxy for women's empowerment and is known to increase the likelihood of method use.

## 6.1. Spousal Communication

Tables 6.1A and 6.1B provide information on women's and men's reported discussions with their spouses on family planning and fertility desires. The questions describe who initiates these discussions, the need for consent from husbands/family on the use of family planning, who decides the type of family planning method used, whether they discuss the number of children they would like and the frequency of such discussions in the last six months.

As Table 6.1A shows, spousal communication on FP is high, with at least 60 percent of women in union reporting that they discussed using FP or the number of children that they would like to have. Among those who did discuss FP, the majority (at least 60 percent across all five cities) had this discussion at least once in the preceding six months. All women surveyed were asked: "If you wanted to use a method of family planning, would you need anyone else's permission?" The responses varied greatly across cities, with only 23 (Kakamega) and 26 (Nairobi) percent of women responding yes to the question compared to 51 percent in Machakos. When asked how the decision on FP method type was made (among ever-users), between 31 percent (Mombasa) and 54 percent (Kakamega) said the decision was made mainly by the woman alone.

Table 6.1A: Percentage distribution of FP, fertility discussion and decision-making among women, by urban area, Tupange/MLE, Kenya, 2010					
Question (women reporting)	Nairobi	Mombasa	Kisumu	Machakos	Kakamega

* number of respondents varies by question			

Men reported even higher levels of discussion of family planning than did women (Table 6.1B) with approximately 75 percent of men in union reporting discussion. Among those who reported having discussed FP, at least 85 percent in every urban area reported having the conversation at least once in the last six months. Also, about 90 percent of the men in each urban area said that talking about FP with their partner was “easy.” In Nairobi and Mombasa, about 40 percent of men reported that both partners initiate the discussion about family planning.

## 6.2. Media Exposure

This section provides information on women’s and men’s exposure to various forms of media including newspaper/print journalism, radio, television, cell phones and the Internet. In addition, this chapter presents data on exposure to family planning messages through these forms of media, as well as to various types of health facilities.

### 6.2.1. General Media Exposure

Table 6.2A displays results for women’s exposure to media. In all cities, half or less than half of women reported reading newspapers or magazines. In contrast, in all cities except Mombasa, three-fourths of women reported listening to the radio at least once a week. In Mombasa, only half of women listened to the radio on a weekly basis, whereas the other urban areas had values between 74 percent and 80 percent. About half of women in all cities except Nairobi watched TV on a weekly basis; in Nairobi this figure was 73 percent. Nearly all women in all urban areas had mobile phone access, the lowest urban area being Kisumu with 89 percent; however, only 70 to 83 percent of women owned their own mobile phone. Internet access either by phone or by computer was below 20 percent in all cities. For all cities, access to every form of media was found in greater proportions among wealthier women.

Men’s media exposure in the three cities is shown in Table 6.2B. Findings show that men are bigger consumers of radio and print media than women in the survey. Access and ownership of mobile phones is also high among men in all three cities, but decreases with men’s socioeconomic status. This indicates the project should seek to target populations via radio and mobile services.

### 6.2.2. Family Planning Media Exposure

This section presents data on women's and men's exposure to family planning messages through various forms of media as well as exposure from various types of health facilities. The results for women are presented in Table 6.2C. Overall, the main sources of information on FP included public and private health facilities, although private facilities were less often a source in Machakos and Kakamega. Other common sources of FP information and messages included friends, television and radio. Very few women (less than 5 percent in any city) reported receiving no information on FP in the last 12 months. Overall, pharmacies, community health workers, traditional birth attendants, parents/spouses and newspapers/magazines were less common sources of family planning messages; however, newspapers magazines were more commonly used as a source of FP information among the wealthier respondents.

Results for men indicate that most men with knowledge of at least one method of family planning are exposed to some form of messaging during their daily lives. About one-third to two-fifths of men report that their main source of FP information in the last 12 months was a public health facility; fewer men than women report private health facilities as a source of information. Interestingly, between 26 percent (Kisumu) and 38 percent (Mombasa) reported obtaining FP information from a friend.

TV and radio remain the main sources of information about family planning, which given men's high consumption of those media (see Table 6.2D), makes sense.

The above findings show where men and women receive their information. However, this does not mean that it would not be possible to try new channels (or combinations of channels). In general, young people tend to be open to new ways to get information, particularly if it is presented in an interesting and easily accessible manner. Tupange should seek to be innovative in its approach and to collect data (through MLE) that assess the relative effectiveness of any such innovations.

# Chapter 7. Key Findings with Programmatic Implications

---

This chapter presents key survey findings that can be used to guide priority areas and Tupange project activities.

## Overall Trends

Overall, the five project sites are characterized by a young population with about 40 percent of surveyed women falling between the ages of 15–24. In addition, about half of both men and women in all cities except Mombasa have attained some secondary level of education. These demographic characteristics, among others, present urban family planning programs with new insights on potential target groups for FP interventions and the design of FP programs. In addition, the study shows mixed results on fertility levels and contraceptive use. The total fertility rate (TFR) is lower in Nairobi, Machakos and Mombasa compared to Kisumu and Kakamega. Fertility levels also vary considerably by wealth quintiles, with poor women reporting higher TFR compared to richer women. Contraceptive prevalence rates of modern methods are almost equal in all cities (an average of 45 percent) except Mombasa, where they are significantly lower (29 percent). There are, however, no major differences in overall CPR by wealth quintiles. Approximately 70 percent of women in all cities except Mombasa (about 60 percent) have ever used a modern contraceptive.

## Knowledge about Family Planning

A vast majority of men and women across all cities know of modern methods of family planning. More women and men are aware of the short-term methods of contraception compared to long-acting and permanent methods. The awareness about natural and traditional methods of FP is generally lower than that for modern methods in all cities. **Recommendation:** *Tupange should focus on increasing knowledge about long-acting and permanent methods.*

## Unmet Need

The survey results also indicate that the unmet need for family planning among the currently married women ranged from 18 percent in the richest quintile in Nairobi to a high of 41 percent in the poorest quintile in Mombasa. Among unmarried sexually active women, unmet need ranged from 26 percent in the middle quintile in Nairobi to a high of 78 percent in the poorest quintile in Mombasa. These figures suggest that women are not accessing the services they want and need, with poor women at a greater disadvantage than richer women. **Recommendation:** *Tupange's focus on the urban poor will address this key gap.*

## Myths and Fears about Family Planning

Incorrect information about contraception is prevalent across all cities and among men and women surveyed, despite high reported knowledge of family planning. Some of the common myths held are that contraceptives can harm the womb; that a person who uses contraception will give birth to deformed babies; and that contraceptives cause cancer. **Recommendation:** *In order to significantly increase uptake of contraception, the project will need to dispel myths and reassure clients of the safety and effectiveness of all FP methods. In addition, health providers will need to counsel clients about how to deal with side effects and provide correct information on all methods.*

## Fertility

The peak age for childbearing is 20–24 across all cities. The early childbearing among women ages 15–19 is prevalent especially among women in Kisumu. The age-specific fertility rates are higher among younger women ages 15–29 compared to older women. **Recommendation:** *Tupange should target youth.*

## Media Exposure among Youth

Data also show that youth use alternative media of communications such as short messages, mobile phones and Internet to access information. **Recommendation:** *By designing a family planning program focusing on youth, and using alternative media of communications commonly used by youth, Tupange has an opportunity of reducing unmet need for family planning and increasing demand for FP-related messages.*

## FP Services

The public sector is a key source of contraceptives among women across all cities, but there are a significant number of women who also obtain contraception from the private sector. For example, between one-third and two-fifths of women in Nairobi and Mombasa, respectively, reported obtaining their most recent method of FP from a private clinic/doctor. A few women also obtained contraception from chemists. **Recommendation:** *Tupange should work to strengthen the private sector as a key source of counseling, information and provision of methods of family planning and develop a stronger linkage between the public and private sectors to manage FP access and referrals.*

## Partner Communication and Male Involvement

Data suggest high levels of partner communication about family planning. More men than women reported discussing FP with their partners. Among men who reported having discussed FP, at least 85 percent reported having the conversation at least once in the last six months. Also, about 90 percent of the men in each urban area said that talking about family planning with their partner was “easy.” However, the survey also shows that some women, especially in Mombasa, needed permission from their partners to use FP. **Recommendation:** *Tupange therefore needs to design messages that reinforce spousal communication and that encourage male involvement in making decisions on family size and use of family planning.*

## Integration of FP and Other Health Services

Provision of family planning alongside other health care services has been shown effective in increasing FP outcomes by reducing waiting time, providing timely counseling and enhancing referral, thus reducing missed opportunities. Across all cities, family planning services were more often made available to women immediately after delivery and less often during vaccination of children, when seeking curative services for children and when receiving HIV testing. **Recommendation:** *Tupange will need to work closely with health facilities in order to integrate FP in to additional service to better reach women seeking other health services. Most important, is the opportunity for Tupange to promote and offer postpartum FP.*

## Contraceptive Prevalence Rate

The contraceptive prevalence rate is modest, at an average of 45 percent except in Mombasa (29 percent). Short-term methods are more common than long-acting and permanent methods across all cities and among both men and women. Though there is no major difference in overall use of modern contraceptives by wealth index, on one hand, poor women tend to rely on short-

term methods for both limiting and spacing births. On the other hand, women in higher wealth quintiles have a more balanced FP method mix. ***Recommendation: Tupange can focus on ensuring that service delivery points provide a well-balanced FP method mix, providers promote more effective contraceptives to women who desire to limit births, and demand creation activities promote long-acting and permanent methods of family planning.***

### **Community Health Workers and FP Promotion**

About one-third of women were willing to receive FP services from a community health worker (CHW). Although community health workers can distribute information, education and communication materials and refer clients for FP services, they are limited in the number of FP commodities they carry (pills and condoms). ***Recommendation: Tupange, through the Kenya Community Health Strategy, can build the capacity of the CHWs to: a) create demand for FP; and b) strengthen the linkage between the community and the health facilities through improved referral systems, access to commodities and support supervision.***

# Appendix A. About the Bill & Melinda Gates Foundation

BILL & MELINDA  
GATES foundation

## FAMILY PLANNING

### STRATEGY OVERVIEW

#### OUR MISSION

Guided by the belief that all lives have equal value, the Bill & Melinda Gates Foundation works to help all people lead healthy, productive lives. Our Global Health Program supports this mission by harnessing advances in science and technology to save lives in poor countries.

We focus on problems that have a major impact on people in the developing world but get too little attention and funding. Where proven tools exist, we support sustainable ways to improve their delivery. Where they don't, we invest in research and development of new interventions, such as vaccines, drugs, and diagnostics.

Our financial resources, while significant, represent a very small fraction of the overall funding needed to improve global health on a large scale. We therefore advocate for the policies and resources needed to provide people with greater access to health solutions. Strong partnerships are also essential to our success in making a difference and saving lives.

#### THE OPPORTUNITY

In recent decades, there have been tremendous improvements in the reproductive health (RH) of men and women in the developing world. From 1965 to 2005, contraceptive use rose from less than 10 percent to 60 percent.<sup>1</sup>

However, in many low income countries, women and men do not have access to the basic supplies and services they need, whether to prevent unwanted pregnancies, ensure safe deliveries, or manage and treat sexually transmitted infections.

More than 200 million women in developing countries do not have access to effective contraception, even while family planning (FP) is one of the most cost-effective ways to reduce maternal, infant, and child mortality.<sup>2</sup> It is estimated that family planning could prevent as many as one in every three maternal deaths and one in every 11 child deaths by allowing women to delay motherhood,

space births, avoid unintended pregnancies and abortions, and stop childbearing when they have reached their desired family size.<sup>1</sup>

Family planning also enhances social development by alleviating poverty; improving the environment, agriculture, water, and sanitation; and increasing access to primary education. Through these many corollary benefits, family-planning programs are essential to achieving development targets, including the Millennium Development Goals (MDGs).<sup>3,4</sup>

Sub-Saharan Africa and South Asia have the highest rates of maternal and infant mortality, and the lowest use of contraception. Early marriage and childbearing before age 18 are also serious public-health problems in many countries, leading to increased maternal and newborn death and disability. Married and unmarried youths have problems accessing contraception information and services. Further, the sexual debut for many African girls is linked to sexual violence, rape, and coercion.<sup>5</sup> New programs must be designed to meet the needs of young men and women in the developing world.

#### OUR STRATEGY

**Family planning is a cost-effective way to save the lives of women and children, and it empowers families to determine the optimal timing and spacing of births. Our vision of success is that all women, men, and adolescents in developing countries know about and have access to quality family planning. We support voluntary family planning as a means to meet the reproductive health needs of men and women and significantly reduce maternal and infant deaths.**

At the global level, our strategy seeks to revitalize interest in family planning and broader reproductive health issues as indispensable to achieving the MDGs. Our work in this area complements our other areas of focus, which include nutrition; maternal, neonatal, and child health; and vaccine-preventable diseases. We are investing in raising

awareness of the need for family planning among donors, country governments, and the private sector; enhancing the efficiency of contraceptive procurement and distribution; and engaging donors, governments, and civil society to better coordinate efforts and increase resources to fund family planning and reproductive health.

Our strategy at a country level is focused on building cost-effective urban supply, demand, and advocacy interventions to increase contraceptive use and improve care. We also will use the evidence we gather to help municipalities provide better family planning and related services, with a focus on the poorest and most vulnerable. Our strategy also prioritizes leveraging private-sector strengths and resources to increase the availability of high-quality and affordable contraceptives.

## INTERVENTION AREAS

### Advocate for sustained funding, improved policies and coordination, and enhanced efficiency in contraceptive procurement at the global level

Globally, there are significant challenges in financing and procuring contraceptives and other reproductive health supplies and services. Decreased donor support for contraceptives, a lack of agreement among stakeholders about the amount of funding needed to achieve gains in family planning, volatile and unpredictable donor funding, and uncoordinated and antiquated global procurement processes—all create inefficiencies, add to costs, and lead to stockouts of contraceptives, wastage of products, poorly managed in-country supply chains, and variable product quality.

Our strategy addresses these challenges by advocating for increased funding for family planning, better coordination among donors and governments to deliver products, services, and enhanced efficiency of contraceptive procurement. Our investments to support these goals include the following initiatives:

- **Countdown 2015 Europe**, a partnership of 17 European nongovernmental organizations (NGOs), to advocate for increased European investment in reproductive health and supplies
- **Reproductive Health Supplies Coalition**, a 78-member organization that includes major donors, technical agencies, and advocates that develop joint strategies and activities to secure reliable contraceptive supplies for developing countries

- **RHInterchange**, a web-based tool that supports contraceptive commodity security by managing inventory and making available accurate and timely information on contraceptive orders and shipments for more than 140 countries
- **Mobilizing for RH/HIV Integration**, a Population Action International program to support advocacy for RH/HIV integration with the Country Coordinating Mechanisms for the Global Fund to Fight AIDS, Tuberculosis and Malaria (Global Fund)
- a grant to the **United Nations Foundation** to boost U.S. support for global family planning and reproductive health

We are monitoring the progress of our work in advocacy, coordination, and procurement by tracking the number of new donors contributing to funding, the increase in funding for family planning and reproductive health from donor countries, and the number of donors and countries providing data to the RHInterchange.

### Increase contraceptive prevalence in urban areas, with a focus on the poor and vulnerable

In 2008, the urban share of the world's population reached 50 percent for the first time.<sup>6</sup> It is predicted that nearly all future global population growth will occur in towns and cities in developing countries. In particular, urban populations in Africa and South Asia—the most rapidly growing regions in the world—are projected to double between 2000 and 2030.<sup>6</sup> Urban births are concentrated among the poorest populations, a significant number of these births are unintended, and the maternal, infant, and reproductive health status of the urban poor is comparable to—or worse than—that of rural residents.<sup>7</sup>

Our strategy focuses on enhancing the delivery of family-planning services to people living in impoverished urban areas. Our main investment in this area is the **Urban Reproductive Health Initiatives**, which aims to significantly increase access to contraceptives in four countries in Sub-Saharan Africa and South Asia: India, Nigeria, Kenya, and Senegal. The initiative will test, validate, and share cost-effective integrated urban interventions to improve RH outcomes among the urban poor.

The overall goal of the Urban Reproductive Health Initiatives grant is to build a robust evidence and knowledge base for designing, implementing, and evaluating the impact of urban RH programs in Sub-Saharan Africa and South Asia in order to enhance global knowledge and inform future FP and RH programs

globally. We will test such key strategic approaches as supply, demand, and advocacy interventions.

Our country programs are driven by locally based organizations and government, centrally involve community leaders and residents in all phases of project planning and administration, and are closely aligned with government and other country activities targeting women's and children's health.

Key outcome measures we are monitoring for this initiative include improved quality of care, increased communication between couples regarding family planning, increased private-sector provision, and increased contraceptive use.

#### **Develop innovative contraceptive technologies**

Many women and men do not use contraception because current methods are often unaffordable, have undesirable side effects, require a skilled health provider to administer them, or can be inconvenient to use.

Our investments focus on identifying new methods that are easy to access and use, for both women and men. We are currently investing in the quality assurance, regulatory approval, and careful introduction of two products in selected countries of Sub-Saharan Africa and South Asia: a long-acting implant that costs 70 percent less than current implants, and a three-month hormonal contraceptive, DMPA-SC in the Uniject™ device. Currently, DMPA is delivered through intramuscular injection, necessitating a health worker to provide the method in most countries. The new DMPA-SC is delivered subcutaneously and thus has the potential to be delivered by non-medical health workers, such as trained community health workers. Implants and DMPA are especially popular in Sub-Saharan Africa, and we are hopeful that these less expensive and more convenient new methods can rapidly increase coverage and use of family planning.

Other methods are needed to address the diverse needs of communities around the world. We are currently investing in an analysis of contraceptive technology needs, forming a global alliance to improve contraceptives for users in developing countries, establishing a contraceptive research agenda, and considering support for an initiative to support young research scientists who specialize in contraceptive discovery and development.

Key outcome measures for this initiative include the development of at least 10 contraceptive candidate leads as well as evidence of increased private-sector participation in contraceptive technology development.

#### **Close key knowledge gaps in family planning**

There remain several critical knowledge gaps for increasing access to family planning and reproductive health. Our strategy supports investments to address these gaps by conducting intensive research and development (R & D) to:

- identify best approaches to support the delay of first birth among young adolescent girls
- develop models to integrate reproductive health and HIV prevention and care services, to increase access for HIV-positive men and women
- develop effective models to integrate family planning into maternal, newborn, and child health programs
- study the roles of diffusion and social norms in sustainable programs

We will measure progress in this area by monitoring the number of proofs-of-concept tested for early adolescent interventions and the number of optimal RH/HIV integration models documented and taken to scale. We are also documenting the diffusion of ideas, products, and services from urban to rural areas and working to understand the role of social norms in sustaining programs.

#### **PROGRESS**

Our partners have had successes in strengthening both donor contributions and coordination efforts affecting contraceptive supply. Some examples of this include:

- With support for a secretariat, the Reproductive Health Supplies Coalition grew from 18 members to a 78-member organization that addresses the fundamental technical and advocacy issues regarding contraceptive supplies.
- The RHInterchange has captured procurement data on more than \$1 billion (U.S.) worth of shipments of contraceptive supplies, including purchases by the United States Agency for International Development (USAID), United Nations Population Fund (UNFPA), International Planned Parenthood Federation, and Ministries of Health.
- With partners, we developed a contraceptive financing mechanism to smooth out volatility in donor funding flows.
- Civil society groups from eight countries were trained to apply for funds from the Global Fund, and successfully secured more than \$100 million (U.S.) for contraceptive supplies.
- We have seen increased funding for international family planning and reproductive health from European institutions, bilateral donors, and the U.S. government.

---

At the country level, several recently launched projects show promise for improving reproductive health for the poor and vulnerable:

- Consortia in India and Nigeria have recently launched Urban Reproductive Health Initiatives with a focus on the urban poor and most vulnerable. Similar initiatives in Senegal and Kenya will be launched later in 2009.
- A Measurement, Learning, and Evaluation (MLE) grant will work closely with country consortia implementing Urban Reproductive Health Initiatives in India, Senegal, Nigeria, and Kenya. MLE and its country partners are developing tools and methodologies to track and measure program impact in urban slums, building host-country capacity, and ensuring that all lessons learned and tools and materials developed will be globally accessible. The goal of MLE is to build a robust evidence and knowledge base for designing, implementing, and evaluating the impact of urban RH programs in Sub-Saharan Africa and South Asia, and then disseminate best practices in order to enhance global knowledge and use.

### **CHALLENGES**

The global community, including both private- and public-sector stakeholders, is not sufficiently galvanized to focus on improving family planning and reproductive health. Governments and other donors are focused on other health priorities, and family planning is competing for scarce monetary and human resources, both at country and global levels. We are working hard to hold both national governments and the global donor community accountable for their own pledges to improve family planning by communicating its importance in reducing maternal and child deaths, enhancing the livelihood of women, and reducing poverty.

An overarching challenge is the persistence of cultural and social barriers that prevent men and women from using effective contraceptive methods and weaken the demand for birth spacing and family planning. In addition to supporting the discovery and development of new family-planning products and services, activities to generate demand for contraceptives are critical features of our country initiatives.

### **WHAT WE'RE LEARNING**

The need to increase contraceptive R & D is a priority for our strategy, but we are increasingly aware that support for young scientists may be insufficient to reinvigorate a field that private companies have left. On September 2, 2009, we opened a Request for Proposal to develop contraceptive technologies as part of our Grand Challenges Explorations initiative. This program awards small grants of \$100,000 (U.S.) each to support early-stage research projects. Our hope is that we will tap into some new ideas that will support family-planning efforts in the future.

To have a sustained impact on contraceptive R & D, we need to develop a complete understanding of the product cycle in order to identify all the areas that need support. We are also examining the potential for working with new partners in India, China, and South Africa, where private companies, manufacturers, and scientists may be able to support a strong contraceptive development program.

### **THE WAY FORWARD**

Over the course of developing this strategy, we received input from dozens of experts who helped us make strategic choices to maximize the impact of our efforts and resources. To ensure our strategy is targeted and effective, we look to outside experts for honest feedback and input.

By focusing on increasing women's access to contraceptives in Sub-Saharan Africa and South Asia, we strive to maximize our impact on the health of mothers and children. Reaching the millions of women and couples who desire contraceptives requires the dedication of all our government, donor, private-sector, research, nongovernmental, and community partners. Because our resources are limited in relation to what is needed to address unmet needs globally, we work closely with other foundations and existing and emerging donors to ensure funds are spent well, improve policies, enhance the efficiency of services procurement and delivery, and, ultimately, save and improve lives.

Guided by the belief that every life has equal value, the Bill & Melinda Gates Foundation works to help all people lead healthy, productive lives. In developing countries, it focuses on improving people's health and giving them the chance to lift themselves out of hunger and extreme poverty. In the United States, it seeks to ensure that all people—especially those with the fewest resources—have access to the opportunities they need to succeed in school and life. Based in Seattle, Washington, the foundation is led by CEO Jeff Raikes and Co-chair William H. Gates Sr., under the direction of Bill and Melinda Gates and Warren Buffett.

For additional information on the Bill & Melinda Gates Foundation, please visit our web site: [www.gatesfoundation.org](http://www.gatesfoundation.org).

# Appendix B. About Tupange

Tupange, the Kenya Urban Reproductive Health Initiative is an innovative five-year Project that aims to improve the health and wellbeing of Kenyans living in urban areas by increasing access and utilization of quality family planning services. It is part of the broader Gates-funded “Urban Reproductive Health Initiative” in four countries: India, Kenya, Nigeria and Senegal.

The goal of this program is to achieve a 20 percentage point increase in contraceptive prevalence rates in three Kenyan cities (Nairobi, Mombasa and Kisumu) especially among the urban poor.

Tupange is implemented by Jhpiego and its consortium partners; Johns Hopkins University Center for Communication Programs, Marie Stopes International, National Coordinating Agency for Population and Development (NCAPD) and Pharm Access Africa. Tupange aims at working with dynamic partners and stakeholders to ensure the success of the project for a healthier future for Kenyan people. These partners include Kenya Government Ministries and departments of Planning, Public Health and Sanitation, Medical Services, Finance, Kenya National Bureau of Statistics (KNBS), Local Government/City/Municipal Councils/County Governments. Other stakeholders include Urban Communities, community-based organizations/faith-based organizations (FBOs)/nongovernmental organizations (NGOs), private providers and USAID, World Bank and other donors.

The project targets Kenyans living in cities and urban centres with a special emphasis to reach the poor, young Kenyans (ages 15–24). By increasing education and awareness about FP and ensuring access to quality FP services among this critical age group, Tupange will help Kenya realize its Vision 2030.

Through a variety of innovative interventions and approaches, Tupange seeks to position family planning as an accepted societal norm among Kenya’s urban populations. Tupange’s vision of success is that the urban poor ultimately adopt family planning as part of a healthy lifestyle.

## Tupange Project Objectives

- To improve quality and availability of FP services (including integrating FP into other services)
- To generate demand for FP services
- To ensure contraceptive security
- To engage the private sector to inform best practices and lessons learned
- To advocate for an improved FP policy environment

# Appendix C. About MLE

Policy Brief

## Study Design for the Measurement, Learning & Evaluation Project

Ashley E. Frost, PhD  
Fariyal F. Fikree, MD, MPH, DrPH

20 October 2009

Family planning has widespread positive effects on health and wellbeing. Contraceptive use not only decreases unintended pregnancy and reduces infant and maternal mortality and morbidity, but it is critical to the achievement of Millennium Development Goals (MDGs). However, despite the expansion of family planning in many developing countries, contraceptive use remains critically low in much of sub-Saharan Africa and parts of South Asia, particularly among the urban poor. In cities in these regions, people living in poverty have limited access to family planning and other basic services; in many countries more than half of city residents live in urban slums that lack necessary amenities such as clean water, trash removal, and electricity. These urban environments provide an opportunity to target family planning interventions towards populations that have high unmet need for contraception through integrating family planning services into maternal, newborn, child health, and HIV/AIDS services, improving service quality, increasing private sector initiatives, and advocating for small family size.

The Bill & Melinda Gates Foundation created the Urban Reproductive Health Initiative (URHI) to promote innovative family planning programs in four countries: India (focusing on the state of Uttar Pradesh), Nigeria, Kenya, and Senegal. Targeting the urban poor, the URHI aims to develop cost-effective interventions that increase access to and demand for high quality family planning. To evaluate the impact of the URHI interventions, the Gates Foundation concurrently initiated the Measurement, Learning & Evaluation (MLE) Project for the URHI, an independent evaluation team that will conduct an impact assessment of the URHI programs. A key

objective of the MLE project is to undertake a rigorous impact evaluation of the URHI country programs, identifying the most effective and cost-efficient programmatic approaches to improving contraceptive use among the urban poor. Specifically, the MLE project will evaluate the success of both *demand-side* URHI interventions (those that increase the desire for family planning services) and *supply-side* URHI interventions (those that increase the quality of and access to family planning services). The MLE project will also undertake a cost-effectiveness analysis of specific programmatic approaches, where feasible. This policy brief outlines the project's hybrid study design and its intended impact.

### Three Evaluation Design Elements

The MLE project evaluation comprises three design elements that allow researchers to measure programmatic impact across cities, over time, and among the urban poor and non-poor.

**Impact Across Cities.** The MLE project will take advantage of the delayed implementation of programmatic activities in some cities to develop a *quasi-experimental* design. In each country, researchers will evaluate four URHI-targeted cities that will receive immediate interventions and two cities that will receive URHI interventions during the third or fourth year of the project. This latter group of cities with delayed URHI interventions will serve as comparison cities. An assessment of these cities with the original set of intervention cities will add variation that will provide more precise measures of program impact.

*This policy brief is based on the Technical Working Paper, "Study Design for the Measurement, Learning & Evaluation Project"*  
[www.cpc.unc.edu/urbanreproductivehealth/publications/Technical\\_Working\\_Paper\\_Study\\_Design.pdf](http://www.cpc.unc.edu/urbanreproductivehealth/publications/Technical_Working_Paper_Study_Design.pdf)

MLE Policy Brief 1-2009

1

[www.urbanreproductivehealth.org](http://www.urbanreproductivehealth.org)

**Impact Over Time.** The MLE project will use a combination of repeated cross-sectional data (surveying a new representative sample of respondents at multiple points in time) and longitudinal data (surveying the same respondents at multiple points in time) in a *hybrid study design*. This hybrid approach maximizes the strengths of both types of data; rigorous cross-sectional surveys provide the attitudes and behaviors of a representative sample of the cities' population at a given point in time, while longitudinal data measure the causal impact of program components on outcomes of interest. The project will also collect longitudinal data from a sample of health and family planning facilities that provide services to women and men – service delivery points (SDPs) – and examine access to and quality of family planning services at these facilities over the study period.

**Impact Among the Urban Poor.** To identify the impact of URHI interventions among the urban poor, the MLE project will structure the sampling of respondents to identify programmatic outcomes among both slum and non-slum populations.

#### **Study Tools**

**Individual Surveys.** The MLE project will conduct confidential surveys with women and men of reproductive age. Women and men will provide their basic demographic characteristics (such as age, ethnicity, family structure, and migration practices), their experience with family planning methods, their awareness of family planning messages, and their fertility desires. In addition, respondents will discuss their current health care experiences, including how they pay for health care and when and where they seek care for themselves and their children. At baseline, the women's survey will also collect information on how to locate these women at mid-term and endline for follow-up surveys. This will permit an examination of how fertility desires and family planning behaviors change over time with increasing program activities and exposure.

**SDP Surveys.** MLE researchers will also collect data at a wide range of public and private SDPs. In facilities with licensed health care providers, the MLE team will conduct facility audits to determine

#### *Identifying the Urban Poor*

To ensure that the urban poor are fully represented in this study, MLE researchers will utilize Geographic Information System (GIS) data to map the location of urban slums and non-slum areas onto maps of the study cities using country-specific definitions of what constitutes a slum. Because the residents of urban slums are predominantly poor, this geographic data will serve as an approximate measure of where poor populations live. From the GIS data, researchers will design sampling frames (a snapshot of the full population of each city) that capture both urban poor and non-poor populations, and they will randomly select members from both groups as survey respondents from these geographically-determined sampling frames.

the services that are provided at each location and the availability of family planning methods and prescription requirements. Fieldwork staff will conduct surveys with health care providers in these facilities to identify their training, standard operating procedures with clients, and referral mechanisms. In addition, the MLE team will conduct exit interviews with women who are leaving these facilities to evaluate satisfaction with health care services. Because family planning services are often available outside health care facilities, the MLE project will also collect data from local pharmacies and other retail outlets that offer contraceptives. In these locations, field workers will take an audit of available contraceptive methods, educational materials, and counseling opportunities, as well as identify the requirements women must meet to obtain a method and the cost of contraceptives.

**Program Cost Analysis.** Impact evaluations also provide an opportunity to determine the cost-effectiveness of different programmatic approaches to ensure that scarce resources are used most efficiently. To conduct these cost analyses, the MLE project will collect detailed information on program costs (including financial contributions and in-kind expenses) over the course of the project. Where possible, this information will contribute to an impact analysis that captures the cost of individual interventions.

## Hybrid Study Design

**Cross-Sectional Data.** The MLE project will conduct cross-sectional surveys with women at two points in time – at baseline prior to the implementation of the URHI programs and at endline of the interventions, four years later. These data will allow the MLE team to determine if the overall contraceptive prevalence rate changes significantly in cities during this period. The MLE team will also collect cross-sectional surveys with men in intervention cities at baseline, mid-term, and endline of the project to measure men’s contraceptive attitudes and behaviors, gender attitudes, and identify any changes in men’s perspectives over time. Because these surveys are cross-sectional, baseline, mid-term, and endline respondents will differ and it will not be possible to attribute changes in knowledge, attitudes, and behaviors directly to program exposure at the individual level.

Cross-sectional data collection requires that researchers use an updated sampling frame to randomly select respondents at each survey round. A sampling frame is a snapshot of the entire population of a study area, in this case, each city, at a given point in time. With an accurate sampling frame, every adult in each city has the same chance of random selection into the study. Because urban populations are quite dynamic – urban migration can change the characteristics of cities quite rapidly – MLE researchers will identify, to the extent possible, updated sampling frames at baseline, mid-term, and endline. By randomly selecting respondents from these sampling frames, each cross-sectional survey will represent the entire population of men or women living in each city at the time of the survey. Thus, the MLE team will assess men’s family planning attitudes and behaviors at three points in time and the contraceptive prevalence rate of each city (calculated from the women’s cross-sectional surveys) at baseline and endline of the study.

**Longitudinal Data.** The MLE project will also collect longitudinal data from women and SDPs. Field workers will first conduct surveys with women and SDPs at baseline of the study, and then follow-up with the same women and SDPs at mid-term and endline. Because longitudinal data permit researchers to measure change over time, this study component will allow the MLE project to identify the causal

impact of the URHI family planning interventions on women’s family planning attitudes and behaviors and also determine if URHI interventions activities improve the quality of family planning services in urban areas.

To maximize the significant resources required to collect both cross-sectional and longitudinal data, the women who are randomly selected as respondents to the baseline cross-sectional survey will become the participants in the longitudinal study. These women will receive follow-up surveys at mid-term and endline. Dovetailing the cross-sectional and longitudinal data collection conserves project resources and ensures that the longitudinal surveys with women represent the larger population of study cities at baseline (as researchers will randomly select these women from a current sampling frame).

One of the challenges of collecting longitudinal data is respondent attrition. Over time, individuals may move households or migrate to other cities or regions, limiting the ability of researchers to conduct follow-up surveys. To mitigate this, MLE researchers will collect detailed tracking information for each woman in the longitudinal survey. This information will include addresses and cell phone numbers for the respondent, as well as the names and contact information for her household members, community leaders, landlords, and friends. If a respondent changes residence before a follow-up survey, the MLE team will use this detailed tracking information to locate the respondent and determine the feasibility of conducting follow-up surveys at her new location.

The longitudinal component of the hybrid study design also includes data collection from a wide range of public and private SDPs. At baseline, MLE researchers will randomly select health care providers offering family planning services, pharmacies, and other retail outlets that offer contraceptives within each study city. Additionally, the sample will include all SDPs that respondents identify in the baseline survey as their preferred location for family planning services. Field workers will conduct follow-up surveys with the same SDPs at mid-term and endline. To track the location of the facilities, researchers will note the GPS coordinate of each SDP during the baseline survey and use this information to easily identify the same facilities upon return visits.

### Data Collection Plan

The MLE project will use a comprehensive evaluation strategy that includes data collection at three time points (baseline, mid-term, and endline), each separated by two years. The MLE team will collect data with women and men using both longitudinal and cross-sectional samples.

At *baseline*, field workers will conduct the first cross-sectional surveys of women and men and the first longitudinal surveys with the SDPs. Respondents to the baseline cross-sectional survey of women will also become the respondents to the longitudinal survey of women; these respondents will receive follow-up surveys at the mid-term and endline.

At *mid-term*, researchers will survey a new, random sample of men for the second cross-sectional men's survey. Field workers will also conduct follow-up surveys with the women interviewed for the baseline cross-sectional survey. These follow-up surveys with women constitute the longitudinal survey of women. Field workers will also conduct the mid-term surveys with the SDPs surveyed at baseline.

At *endline*, field workers will conduct follow-up longitudinal surveys with women and SDPs. The MLE research team will also survey a new, random sample of women and men for the endline cross-sectional surveys. These surveys will represent the larger population of each city at this point in time.

### Conclusion

The MLE project is a quasi-experimental study that includes four intervention cities where the URHI will implement innovative family planning programming, and two comparison cities where programming is delayed in each URHI-supported country. The study design is a hybrid design that integrates cross-

Data Collection Plan		
	Cross-Sectional Surveys	Longitudinal Surveys
Baseline	Women <sup>1</sup> Men	SDPs <sup>2</sup>
Mid-term	Men	Women <sup>1</sup> SDPs <sup>2</sup>
Endline	Women Men	Women <sup>1</sup> SDPs <sup>2</sup>
<sup>1</sup> Women in these surveys are the same <sup>2</sup> SDPs in these surveys are the same		

sectional and longitudinal data to assess the direct impact of innovative family planning programs and identify any change in the contraceptive prevalence rate and behavioral and attitudinal norms in intervention cities over the course of the URHI. To identify the specific reproductive health needs of the urban poor, the MLE project will structure the sampling of respondents to identify outcomes among both slum and non-slum populations. These design elements allow the MLE project to measure programmatic impact across cities, over time, and among the urban poor and non-poor.

Identifying the successes of family planning interventions – assessing supply-side programs that increase access to quality family planning and demand-side programs that change behaviors among individuals, households, and communities – requires that evaluation occur concurrently with programs. Because very few evaluations of family planning programs are conducted in this way, policymakers have few evidence-based recommendations to inform the allocation of scarce family planning resources. The MLE project will provide critical evidence-based findings to inform policymakers and improve the design of integrated family planning and reproductive health interventions that target the urban poor in South Asia and sub-Saharan Africa.

The Measurement, Learning & Evaluation (MLE) Project for the Urban Reproductive Health Initiative (URHI) identifies approaches that increase contraceptive prevalence rates in rapidly growing cities in India, Nigeria, Kenya, and Senegal. The MLE project serves as the technical resource for local efforts to monitor and evaluate URHI programs in these countries and documents evidence-based best practices for health services that target the urban poor. The MLE project shares promising approaches with policy makers, program managers, and researchers globally and builds local capacity to undertake rigorous measurement and evaluation of population, family planning, and integrated reproductive health activities targeting vulnerable urban populations.

*This report was made possible by support from the Bill & Melinda Gates Foundation under terms of the MLE project for the Urban Reproductive Health Initiative. The MLE project is implemented by the Carolina Population Center at the University of North Carolina at Chapel Hill, in partnership with African Population and Health Research Center, International Center for Research on Women, and Population Reference Bureau. The authors' views expressed in this publication do not necessarily reflect the views of the donor, the Gates Foundation.*

# Appendix D. About Kenya National Bureau of Statistics

---

The Kenya National Bureau of Statistics (KNBS) is a Semi-Autonomous Government Agency under the Ministry of Planning, National Development & Vision 2030. KNBS was established by an Act of Parliament - the Statistics Act, 2006 No.4 to replace the erstwhile Central Bureau of Statistics (CBS) established in 1960's. The Statistics Act 2006 specifically mandates KNBS to:

- Act as the principal agency of the government for collecting, analyzing and disseminating statistical data in Kenya.
- Act as custodian of official statistics.
- Conduct the Population and Housing Censuses every ten years, and such other censuses and surveys as the Board may determine.
- Maintain a comprehensive and reliable national socioeconomic database.
- Establish standards and promote the use of best practices and methods in the production and dissemination of statistical information across the National Statistical System(NSS).
- Plan, authorize, coordinate and supervise all official statistical programs undertaken within the NSS.

The Bureau develops and maintains the National Sampling Survey and Evaluation Program (NASSEP), which provides the framework for designing household sample based - surveys to generate different forms of household based data. It maintains a Master File of all establishments in the country. The Master File provides a framework of collecting establishment based data.

KNBS has an elaborate infrastructure for data collection, which includes District Statistical Offices in every district. The Bureau is also the custodian of all government statistical information, and for this it maintains a database of all national surveys including National Population and Housing Censuses. KNBS is organized into six Directorates, each headed by a Director.

The six Directorates are:

- Directorate of Macroeconomic Statistics
- Directorate of Production Statistics
- Directorate of Population and Social Statistics
- Directorate of Strategy and Development
- Directorate of Information and Communication Technology
- Directorate of Finance and Administration

The Bureau supports the development of statistics in various key Government Departments/ Ministries/ Agencies such as Ministries of Health, Education, Gender, Home Affairs (Prisons and Probation), The Judiciary, Police, Department of Civil Registration, National Registration Bureau, Central Bank of Kenya, Kenya Revenue Authority and etc. KNBS activities are mainly funded by the Exchequer, Development partners and the STATCAP Project- A Statistical Capacity project in KNBS, funded by the World Bank and other development partners and established to fund various capacity building projects within the NSS.

Apart from conducting Population and Housing Censuses after every ten years as recommended by the United Nations, KNBS undertakes two broad types of surveys, namely, household-based surveys and establishment based surveys. Some of the surveys are regular such as the KDHS which are conducted after every five years while others are ad-hoc in nature. These include - but are not limited to - the following:

- Kenya Integrated Household Budget Survey
- Kenya Demographic and Health Survey
- Malaria Indicator Survey
- Adult Literacy Survey
- Disability Survey
- Kenya AIDS Indicator Survey
- Multiple Indicator Cluster Survey
- Consumer Price Index
- Producer Price Index
- Labour Force Survey
- Micro and Small Enterprise Survey
- Child Labour Survey
- Agriculture and Livestock Survey
- Time Use Survey
- Foreign Investment Survey
- Integrated Survey of Enterprises
- Informal Cross Border Trade Survey
- Survey of villas, cottages and campsites
- Financial Access Survey
- Inbound Outbound Survey
- Survey on Expansion of Coverage of Financial Institutions
- Annual Survey on Industrial Production
- Building and Construction Survey
- Survey of Quarrying and Mining
- Census of Industrial Production
- Violence Against Children Survey

In 2010, KNBS implemented the Measurement Learning and Evaluation baseline household survey for the Kenya Urban Reproductive Health Initiative. Specifically, KNBS generated the sampling frame for the survey, recruited and trained the data collection teams, and managed the collection of data and entry of the survey questionnaires. KNBS was also involved in the dissemination of the survey results at national and city levels.

## Woman Consent Form: Household-Based Survey on Family Planning

### Purpose of Study

Hello! My name is \_\_\_\_\_, I am part of a research team working for the Kenya National Bureau of Statistics. We are carrying out research on family planning in urban areas of Kenya. Your participation in this study will help to improve family planning services in this city. We will be asking questions to all women aged 15-49 from this household for this study.

*Habari! Jina langu ni \_\_\_\_\_, mimi ni mojawapo ya watafiti wanao fanya kazi na shirika la Kitaifa la Kenya la Takwimu. Tunafanya utafiti kuhusu upangaji wa uzazi katika miji ya Kenya. Kushiriki kwako katika utafiti huu kutasaidia kuimarisha huduma za upangaji wa uzazi katika jiji hili. Katika utafiti huu, nitauliza maswali wanawake wote kati ya miaka 15 hadi 49 wanoishi katika nyumba hii.*

### Explanation of Procedures

The interview will take place in or around your home, somewhere private. The interview will take about 60 minutes. I will ask you questions about your home, family planning, health-care seeking, and family size decisions. You may choose not to give the interview, or not to answer a question for any reason. You can stop the interview at any time by telling me that you want to stop it. If you decide not to give the interview or not to answer a question, no harm will come to you, and there will be no effect on your access to health services in the future.

*Mahojiano yatafanyika ndani au nje ya nyumba yako pahali ambapo hatuasikika na mtu mwingine. Mahojiano yatachukua muda wa kama dakika 60 hivi kukamilika. Nitakuuliza maswali kuhusu nyumba yako/nyenu, upangaji wa uzazi, uamuzi kuhusu kutafuta huduma za afya na pia uamuzi kuhusu kiwango cha familia.*

*Waweza kuamua kukataa kushiriki, ama kutojibu swali lolote kwa sababu yoyote ile. Waweza kusimamisha majadiliano wakati wowote kwa kunieleza kuwa wataka kuyasimamisha. Ukiamua kutoshiriki majadiliano ama kutojibu swali lolote, hakuna athari itatokea kwako, wala hakutakuwa na athari kwako kuhusu kupata huduma za afya kwa siku zijazo.*

### Confidentiality

Your answers will not be shared with anyone outside this research project. Your name will not appear on the survey. We will not share answers with community members, health providers, family or anyone else. At the end of the study, we will put all the answers together and make a report. In addition to the interview today, we would like to meet with you twice more to ask you some more questions. We will need to contact you in 2 years to interview you a second time, and again two years after that to interview you a third time. We would like to interview you three times to see how the circumstances in your life change.

So we can find you again in two years, we need to ask questions on how, where and when to best contact you. We will make every effort to plan the next interview without anyone knowing. Your contact information will be kept in a locked cabinet, and kept apart from your answers to the questions. Once the study is finished, the list of names with your contact information, and the completed surveys will be destroyed.

*Majibu yako hayataambiwa mtu mwingine kando na watafiti wanao shiriki katika mradi huu. Jina lako halitachapishwa kwa utafiti huu. Hatutatoa majibu yako kwa watu wa jamii hii, wahudumu wa afya, watu wa familia yako wala mtu mwingine yeyote. Mwisho wa utafiti huu tutayaweka majibu yote pamoja na kuandika ripoti.*

*Kadhhalika, kando na mahojiano ya leo, tungependa kukuona wewe pamoja na wengine (waume/wake) wa nyumba hii mara mbili zaidi ili tukulize mswali mengine. Tutahitaji kuwasiliana tena baada ya miaka miwili ijayo ili kuwa na majadiliano ya pili, na pia miaka mingine miwili baadae ili kujadiliana tena kwa mara ya tatu. Tungependa kujadiliana nawe mara tatu ili kuweza kuona vile hali ya maisha yako inavyobadilika.*

*Ili kuweza kuwapata watu wanaishi hapa kwa mara nyingine, tutahitaji kuuliza maswali kuhusu vipi, wapi na lini tutakavyo weza kuwasiliana nawe. Tutafanya jitihada zote tuwezavyo kupanga majadiliano yatakayofuata bila mtu mwingine kujua. Habari ya jinsi ya kuwasiliana nawe zitafungiwa kwenye kabati, mbali na majibu yote ambayo utatupa. Utafiti huu ukishakamilika, orodha ya majina na habari za mawasiliano na pia majibu yote ya maswali yataharibiwa.*

### How many people will take part in this study?

If you decide to be interviewed, you will be one of about 11,000 women from urban areas of Kenya who will be interviewed.

*Ukiamua kuendelea na majadiliano, utakua mmoja kati ya wanawake 11,000 kutoka katika miji ya hapa Kenya ambao watajadiliana nasi.*

### Benefits

Research helps society by providing new knowledge. You may not benefit directly from this survey. However, your answers will be important for planning better programs to make sure women can access the health care they need.

*Utafiti husaidia jamii kwa kutoa ufahamu mpya. Huenda usifaidike kibinafsi kutokana na utafiti huu. Hata hivyo majibu yako yatakua muhimu katika kupanga miradi bora zaidi ili kuhakikisha kwamba wanawake na wanaume wanapata huduma za afya wanazo zihitaji.*

### Risks and Discomforts

There is the possibility you may feel uncomfortable about a question I ask. If you feel uncomfortable about any of the questions, you do not have to answer them. I can skip those questions and go on to the next section. You can end the interview at any time. There is also the possibility that someone may approach us during the interview to find out what we are discussing. We intend to do this interview in private, if someone approaches us, we will stop the interview until we can continue in private. Some questions may not apply to you, but the interviewer must ask the same questions of everyone.

*Kuna uwezekano kuwa utahisi kutopendezwa na maswali fulani nitakayo uliza. Ukihisi kutopendezwa kuhusu maswali yoyote, siyo lazima uyajibu. Ninaweza yaruka maswali hayo na kuanza sehemu nyingine. Unaweza utamatisha majadiliano wakati wowote.*

*Kuna uwezekano pia mtu mwingine aweza kuja wakati tunapoendelea na majadiliano kutaka kujua ninini tunachojadiliana. Tunatumaini kufanya majadiliano kwa siri, na ikiwa mtu ataturubia, tutaacha majadiliano hadi tutakapo baki wawili. Maswali mengine yawezakuwa hayakuhusu lakini ni lazima kuuliza maswali sawa kwa kila mtu kwa sababu ya utafiti.*

**Costs and Payment for Participation**

There are no costs for being in this study. You will not receive any compensation for taking part in this study. *Haikugharimu chochote kushiriki katika utafiti huu. Hutapokea pesa zozote kwa kushiriki katika utafiti huu.*

**Questions / Your rights as Participants**

This study has been approved by the Kenya Medical Research Institute, and the University of North Carolina (USA). If you have any questions about this study or the results, you can contact the following: The study coordinator at the Kenyan National Bureau of Statistics Mr Christopher Ndayara Omolo at 020 2244079, the study coordinator at APHRC Mr Paul Kuria 020 2720400, The Secretary, National Ethics Review Committee at Kenya Medical Research Institute at +254 (020) 2722541, 2713349. Or the Institutional Review Board at the University of North Carolina at +1 919-966-3113. You have the right to ask, and have answered, any questions you may have about this research. If you have questions or concerns, you should contact the researchers listed above, or ask me before or after the interview. Do you have any questions now?

*Utafiti huu umeidhinishwa na Shirika la Kenya la Utafiti wa Matibabu, na Chuo Kikuu cha North Carolina (Marekani). Kama una maswali yeyote kuhusu utafiti huu ama matokeo yake, unaweza kuwasiliana na wafuatao: Mwelekezi wa utafiti wa Shirika la Kitaifa la Kenya la Takwimu Bwana Christopher Ndayara Omolo kwa nambari 020 2244079; Mwelekezi wa utafiti wa shirika la APHRC Bwana Paul Kuria 020 2720400, Katibu wa Kamati ya Kitaifa ya Kuchunga Maadili katika Shirika la Kenya la Utafiti wa Matibabu nambari +254 (020) 2722541, 2713349. ama Bodi ya Kuchunga Taasisi ua Chuo Kikuu cha North Carolina kwa nambari +1 919-966-3113. Una haki ya kuuliza maswali yoyote na kupata majibu yake kuhusiana na utafiti huu. Ikiwa una maswali ama shauku zozote, wasiliana na watafiti walio orodheshwa hapa, ama uniulize mimi maswali kabla au baada ya majadiliano. Je, una maswali sasa?*

**Consent**

Now, can you tell me if you agree to participate in this research? If you say yes, it means that you have agreed to be part of the study.

Yes No

*Sasa waweza kuniambia kama unakubali kushiriki katika utafiti huu? Ukisema ndiyo, inamaanisha kuwa umekubali kushiriki katika utafiti huu.*

*Ndio La*

Would you like a copy of this document?

Yes No

*Je, wataka nakala ya stakabadhi hii?*

*Ndio La*

SECTION 2: REPRODUCTION			
QNo.	Questions and filters	Coding categories	Skip to
Now I would like to ask you about all the births you have had during your life. Please be as honest as possible and know that your answers will not be shared with anyone else. <i>Sasa ningependa kukuuliza kuhusu mamba ulizopata au watoto uliowazaa katika maisha yako. Tafadhali nipe majibu ya ukweli na ujuwe kwamba majibu yako hayatajulishwa mtu mwingine.</i>			
Q201	Have you ever given birth? <i>Umewahi kuzaa/kujifungua?</i>	YES..... 1 NO..... 2 → Q206	
Q202	Do you have any sons or daughters <u>to whom you have given birth</u> who are now living with you? <i>Una wavulana au wasichana wowote ambao umewazaa wewe mwenyewe na wanaishi pamoja nawe kwa sasa?</i>	YES..... 1 NO..... 2	
Q203	CHECK Q202: IF "NO" ABOVE, RECORD "OO" FOR BOTH SONS AND DAUGHTERS AT HOME. THEN CONTINUE TO Q204. IF "YES" ABOVE, ASK...  How many of these sons live with you? And how many of these daughters live with you? <i>Ni wavulana wangapi wanaoishi pamoja na wewe? Ni wasichana wangapi wanaoishi pamoja na wewe?</i>	SONS AT HOME..... [ ][ ] DAUGHTERS AT HOME..... [ ][ ]	

Q204	Do you have any sons or daughters <b>to whom you have given birth</b> who are alive but do <b>not</b> live with you?  <i>Je una wavulana au wasichana ambao umewazaa na wako hai lakini hawaishi na wewe?</i>	YES..... 1 NO..... 2	
Q205	CHECK Q204: IF "NO" ABOVE, RECORD "OO" FOR BOTH SONS AND DAUGHTERS ELSEWHERE. THEN CONTINUE TO Q206. IF "YES" ABOVE, ASK...  How many sons are alive but not living with you? And how many daughters are alive but not living with you? <i>Ni wavulana wangapi waliohai lakini hawaishi pamoja na wewe?</i> <i>Ni wasichana wangapi waliohai lakini hawaishi pamoja na wewe?</i>	SONS ELSEWHERE..... [ ][ ] DAUGHTERS ELSEWHERE..... [ ][ ]	
Q206	Sometimes it happens that children die. It may be painful to talk about and I am sorry to ask you about painful memories, but it is important to get correct information. Have you ever given birth to a boy or a girl who was born alive but later died? IF NO, PROBE: Any baby who cried or showed signs of life but did not survive?  <i>Wakati mwingine watoto huaga dunia. Ni uchungu kukuzungumzia na nasikitika kukuuliza habari za huzuni, lakini ni muhimu kupata habari kamili. Je, umewahi kujifungua/kuzaa mvulana ama msichana akiwa hai kisha akaaga dunia baadaye?</i> <b>KAMA LA ULIZA ZAIDI:</b> kuna mtoto aliye lia na kuonyesha ishara ya uhai kisha akaaga dunia baadae?	YES ..... 1 NO ..... 2	
Q207	CHECK Q206: IF "NO" ABOVE, RECORD "OO" FOR BOTH SONS AND DAUGHTERS DEAD. THEN CONTINUE TO Q208. IF "YES" ABOVE, ASK...  How many boys have died? And how many girls have died? <i>Ni wavulana wangapi wameaga dunia?</i> <i>Ni wasichana wangapi wameaga dunia?</i>	BOYS DEAD..... [ ][ ] GIRLS DEAD..... [ ][ ]	
Q208	SUM ANSWERS TO 203, 205, AND 207, AND ENTER TOTAL.	TOTAL.....[ ][ ]	
Q209	CHECK 208: Just to make sure that I have this right: you have had in TOTAL _____ births during your life. Is that correct? <i>Ili kuhakikisha kuwa nimepata habari sahihi: Umejifungua kwa jumla mara _____ maishani mwako. Hiyo ni sawa?</i>  YES <input type="checkbox"/> NO <input type="checkbox"/> → PROBE AND CORRECT 201-208 as necessary.		
Q210	Have you ever had a pregnancy that ended in a miscarriage or abortion? By miscarriage or abortion, I mean a pregnancy that ended early, either because you did something to make it end or because it just ended by itself. <i>Umewahi kupata mimba halafu ikaharibika au ikatoka. Kuharibika au kutoka ni mimba kutoka mapema aidha kwa ajili ilifanywa kitu au iliharibika yenyewe?</i>	YES..... 1 NO..... 2 → Q212	
Q211	When did the last such pregnancy end? <i>Ni lini mimba ya aina hiyo ilitoka?</i>	MONTH.....[ ][ ] DON'T KNOW MONTH.....98 YEAR.....[ ][ ][ ][ ] DON'T KNOW YEAR....9998	

Q212	<p>Have you ever had a pregnancy that ended in a stillbirth? By still birth, I mean a baby that was born at full term and did not show any sign of life.</p> <p><i>Umewahi kuzaa mtoto aliyefariki tumboni? Yaani mtoto ambaye siku za mimba yake zimekamilika lakini alipozaliwa hakuwa na dalili zozote za kuwa hai (kama kulia ama kupumua)</i></p> <p><b>COMMENT: THESE WORDS IN BRACKETS ARE ANECDOTES, I.E. NOT PART OF ABOVE QUESTION IN ENGLISH.</b></p>	<p>YES..... 1</p> <p>NO..... 2 → <b>Q214</b></p>	
Q213	<p>When did the last such pregnancy end?</p> <p><i>Mara ya mwisho ulipozaa mtoto wa aina hiyo ilikua lini?</i></p>	<p>MONTH.....[ ][ ]</p> <p>DON'T KNOW MONTH.....98</p> <p>YEAR..... [ ][ ][ ][ ]</p> <p>DON'T KNOW YEAR..9998</p>	
Q214	<p>CHECK Q208, Q210 AND Q212:</p> <p>ONE OR MORE BIRTHS, ABORTIONS, MISCARRIAGES, OR STILLBIRTHS</p> <p><input type="checkbox"/> ↓</p>	<p>HAS HAD NO BIRTHS, NO ABORTIONS, NO MISCARRIAGE, AND NO STILLBIRTHS</p> <p><input type="checkbox"/> → <b>Q235</b></p>	

Q215	<p>How old were you when you got pregnant for the very <b>first time</b>?</p> <p><i>Ulikuwa na umri gani ulipopata mimba yako ya kwanza?</i></p>	<p>[ ][ ][ ]</p> <p>RECORD EXACT AGE</p>	
Q216	<p>At the time you became pregnant the first time, did you want to become pregnant <b>then</b>, did you want to wait until <b>later</b>, or did you <b>not want</b> to have any children at all?</p> <p><i>Ulipopata mimba ya kwanza, ulikua unataka kupata mimba wakati huo, au ulitaka kungoja hadi baadaye ama hukutaka kupata watoto kamwe?</i></p>	<p>THEN.....1 → <b>Q217B</b></p> <p>LATER..... 2</p> <p>NOT AT ALL.....3 → <b>Q217B</b></p>	
Q217	<p>How much longer would you have liked to wait?</p> <p><i>Ulikuwa unapenda kungoja kwa mda gani?</i></p> <p>IF RESPONSE IS A DECIMAL FOR MONTHS &amp; YEARS (2.5YRS), THEN CONVERT IN MONTH AND FILL IN ONLY MONTHS.</p>	<p>MONTHS.....1 [ ][ ]</p> <p>OR</p> <p>YEARS.....2 [ ][ ]</p> <p>OR</p> <p>OTHER (SPECIFY).....996</p> <p>OR</p> <p>DON'T KNOW...998</p>

## BIRTH HISTORY

You told me that you have had a total of \_\_\_\_\_ births (check Q209). Now I would like to record the names of all your **live** births, whether still alive or not, starting with the first one you had. Umeniambia ulizaa jumla ya watoto \_\_\_\_\_. Sasa ningetaka kurekodi majina yote ya watoto uliowazaa wakiwa hai, hata kama hivi sasa wako hai ama wameaga, kuanzia wa kwanza

RECORD NAMES OF **ALL** THE BIRTHS in Q209 in Q218. RECORD TWINS AND TRIPLETS ON SEPARATE LINES. IF THERE ARE MORE THAN 18 BIRTHS, USE AN ADDITIONAL QUESTIONNAIRE. CIRCLE ALL CHILDREN BORN IN 2008 OR LATER.

(Q21 7C) Line no.	(Q218) What name was given to your (first/next) baby? <i>Mtoto wa kwanza aliitwa nani? (anayefuata)?</i>	(Q219) Were any of these births twins/triplets?  <i>je, kuna mapacha ama watatu</i>	(Q220) Is (NAME) a boy or a girl?  <i>Je (JINA) ni Mvu-lana Ama msi-chana</i>	(Q221) In what month and year was (NAME) born? PROBE: What is her/his birthday? (other probes: what season was it)  <i>Ni mwezi gani na mwaka gani (JINA) alizaliwa?  ULIZA: Siku yake ya kuzaliwa ni ipi?  ULIZA: Alizaliwa msimu upi</i>	(Q222) Is (NAME) still alive?  <i>(JINA) yuko hai?</i>	(Q223) IF ALIVE: How old was (NAME) at his/her last birthday?  <i>KAMA YUKO HAI: (JINA) alifikisha miaka mingapi tarehe ya mwisho kuadhimisha siku yake ya kuzaliwa?  RECORD AGE IN COMPLETED YEARS; IF LESS THAN ONE YEAR, RECORD "00".</i>	(Q224) IF ALIVE: Is (NAME) living with you?  <i>KAMA YUKO HAI: Je, (JINA) anaishi pamoja na wewe?</i>	(Q225) <b>IF DEAD:</b> How old was (NAME) when she/he died? IF LESS THAN 2 YEARS, PROBE: How many months old was (NAME)?  <b>KAMA AMEAGA:</b> <i>(JINA) alikuwa na miaka mingapi alipoaga dunia? KAMA ANA MWAKA 2 ULIZA ZAIDI: (JINA) alikuwa na miezi mingapi?</i>  IF LESS THAN 1 MONTH OLD, RECORD DAYS; IF LESS THAN 2 YEARS, RECORD MONTHS	(Q226) Were there any other live births between (NAME OF PREVIOUS BIRTH) and (NAME), including any children who died after birth?  <i>Ulizaa mtoto yeyote hai kati ya (ALIYE ZALIWA AWALI) Na (JINA) Nijulishe hata kama aliaga dunia baada ya kuzaliwa?</i>

### SECTION 3: CONTRACEPTION

CHECK FOR PRESENCE OF OTHERS. BEFORE CONTINUING, MAKE EVERY EFFORT TO ENSURE PRIVACY.

Now I would like to talk about family planning, the various ways or methods that a couple/ partners can use to delay or avoid a pregnancy.  
*Sasa ningependa kuongea kuhusu upangaji uzazi, njia tofauti ambazo wapenzi wanaweza kutumia ili kuchelesha au kuzuia kupata mimba.*

INSTRUCTIONS: CIRCLE '1' FOR EACH METHOD MENTIONED SPONTANEOUSLY. THEN PROCEED DOWN COLUMN READING THE NAME AND DESCRIPTION OF EACH METHOD NOT MENTIONED SPONTANEOUSLY. CIRCLE '2' FOR EACH METHOD RECOGNIZED UPON LISTENING TO DESCRIPTION. CIRCLE '3' FOR EACH METHOD NOT MENTIONED NOR RECOGNIZED.

Q301. Which ways or methods have you heard of?  
*Ni njia zipi ambazo umewahi kuzisikia?*

PROBE: HAVE YOU HEARD OF ANY OTHER WAYS OR METHODS THAT WOMEN OR MEN CAN USE TO AVOID PREGNANCY?

*Je umewahi kusikia kuhusu mbinu au njia nyingine ambazo wanawake au wanaume wanaweza kutumia ili kuzuia kupata mimba?*

FOR METHODS NOT MENTIONED SPONTANEOUSLY, ASK:

Have you ever heard of (METHOD)?

*Je, umewahi kusikia kuhusu (NJIA)?*

Q302. Have you ever used (METHOD)?  
**Umewahi kutumia (MBINU)**

		Yes, Mentioned Spontaneously	Yes, When Probed	No	
01	<b>FEMALE STERILIZATION/ TUBAL LIGATION</b> Women can have a simple operation to avoid having any more children  <b>KUFUNGA UZAZI KWA WANAWAKE</b> <i>Kufungwa kwa mishipa inayopitisha yai la mama</i> <i>Wanawake wanaweza kufanyiwa upasuaji/oparesheni kuzuia kupata watoto wengine</i>	1	2	3 → <b>Next Method</b>	Have you ever had an operation to avoid having any more children? <i>Umewhi kufanyiwa upasuaji kuzuia kupata watoto wengine?</i>  YES..... 1 NO..... 2
02	<b>MALE STERILIZATION/VASECTOMY</b> Men can have a simple operation to avoid having any more children.  <b>KUFUNGWA UZAZI KWA WANAUME</b> <i>Wanaume wanaweza kufanyiwa upasuaji/oparesheni kuzuia kupata watoto.</i>	1	2	3 → <b>Next Method</b>	Has your partner ever had an operation to avoid having any more children? <i>Je mume/mpenzi wako amewahi kufanyiwa upasuaji kuzuia kupata watoto wegine?</i>  YES..... 1 NO..... 2
03	<b>DAILY PILL</b> Women can take a pill every day to avoid becoming pregnant. <i>TEMBE ZA KILA SIKU. Wanawake wanaweza kumeza tembe kila siku kuzuia kupata mimba.</i>	1	2	3 → <b>Next Method</b>	YES..... 1 NO..... 2
04	<b>IUCD</b> Women can have a loop or coil placed inside them by a health provider.  <i>IUCD wanawake wanaweza kuwekwa COIL ndani yao na mhudumu wa afya kuzuia mimba.</i>	1	2	3 → <b>Next Method</b>	YES..... 1 NO..... 2
05	<b>INJECTABLES OR INJECTIONS</b> Women can have an injection by a health provider that stops them from becoming pregnant for one or more months.  <i>SINDANO, wanawake wanaweza kudungwa sindano na mhudumu wa afya kuzuia kupata mimba kwa mwezi mmoja ama zaidi.</i>	1	2	3 → <b>Next Method</b>	YES..... 1 NO..... 2
06	<b>IMPLANTS/NORPLANT</b> Women can have a small rod placed in their upper arm by a health provider, which can prevent pregnancy for one to three years. <b>NORPLANT</b>  <i>Wanawake wanaweza kuwekwa NORPLANT kwenye sehemu ya juu kwa mkono na mhudumu wa afya kuzuia mimba kwa mwaka mmoja hadi miaka mitatu</i>	1	2	3 → <b>Next Method</b>	YES..... 1 NO..... 2

Q301. Which ways or methods have you heard of? <i>Ni njia zipi umewahi kuzisikia?</i>				Q302. Have you ever used (METHOD)? <i>Umewahi kutumia (MBINU)</i>				
FOR METHODS NOT MENTIONED SPONTANEOUSLY, ASK: Have you ever heard of (METHOD)? <i>Umewahi kusikia kuhusu (NJIA)?</i>				Yes, Mentioned Spontaneously	Yes, When Probed	No		
07	MALE CONDOM Men can put a rubber sheath on their penis before sexual intercourse.  <i>KONDOMU/MPIRA WA WANAUUME. wanaume wanaweza visha mpira kwenye uume wao kabla ya kufanya ngono</i>	1	2	3 → Next Method	YES..... 1 NO..... 2			
08	FEMALE CONDOM Women can place a sheath in their vagina before sexual intercourse.  <i>KONDOMU /MPIRA WA WANAWAKE. Wanawake wanaweza ingiza ndani ya uke wao mpira kabla ya kufanya mapenzi.</i>	1	2	3 → Next Method	YES..... 1 NO..... 2			
09	STANDARD DAYS/ SAFE DAYS/ CYCLE BEADS: Every month that a woman is sexually active she can avoid pregnancy by not having sexual intercourse on the days of the month she is most likely to get pregnant.  <i>SIKU MAALUM/ SIKU SALAMA: kila mwezi mwanamke anaweza kujizuia kufanya ngono siku ambazo kuna uwezekano zaidi wa kupata mimba</i>	1	2	3 → Next Method	YES..... 1 NO..... 2			
10	WITHDRAWAL Men can be careful and pull out before climax.  <i>KUTOA UUME, wanaume wanaweza kuwa waangalifu na kuchomoa uume wao kabla ya kumwaga mbegu/kufikia kilele.</i>	1	2	3 → Next Method	YES..... 1 NO..... 2			
11	EMERGENCY CONTRACEPTION/MORNING AFTER PILL/ POSTINOR 2 Women can take pills up to five days after sexual intercourse to avoid becoming pregnant  <i>EC/ TEMBE ZA DHARURA/ POSTINOR 2 wanawake wanaweza kumeza tembe ya kuzuia mimba kati ya siku ya kwanza hadi ya tano baada ya kufanya ngono.</i>	1	2	3 → Next Method	YES..... 1 NO..... 2			
12	LACTATIONAL AMENORRHEA (LAM) Up to six (6) months after childbirth, a woman can use a method that requires that she feeds the baby with only breastmilk (no other formula, water or other food) and that her menstrual period has not returned.  <i>NJIA YA KUNYONYESHA PEKEE: hadi miezi sita baada ya mtoto kuzaliwa mwanamke anaweza kutumia njia inayombidi kunyonyesa pekee (bila kumlisha mtoto chakula chochote kingine) na kabla damu ya mwezi kurudi.</i>	1	2	3	YES..... 1 NO..... 2

**END THE INTERVIEW AND THANK THE RESPONDENT FOR HER TIME AND PARTICIPATION.**

## Man Consent Form for Household-Based Survey on Family Planning Behavior

### Purpose of the study

Hello! My name is \_\_\_\_\_ I am part of a research team working for the Kenya National Bureau of Statistics. We are carrying out research on family planning in urban areas of Kenya. Your participation in this study will help to improve family planning services in this city. We will be asking questions to all men aged 15-59 from this household for this study.

*Habari! Jina langu ni \_\_\_\_\_, mimi ni mojawapo ya watafiti wanao fanya kazi na shirika la Kitaifa la Kenya la Takwimu. Tunafanya utafiti kuhusu upangaji wa uzazi katika miji ya Kenya. Kushiriki kwako katika utafiti huu kutasaidia kuimarisha huduma za upangaji wa uzazi katika jiji hili. Katika utafiti huu, nitauliza maswali wanaume wote kati ya miaka 15 hadi 59 wanoishi katika nyumba hii.*

### Explanation of Procedures

The interview will take place in or around your home, somewhere private. The interview will take about 45 minutes. I will ask you questions about your home, family planning, health-care seeking, and family size decisions.

You may choose not to give the interview, or not to answer a question for any reason. You can stop the interview at any time by telling me that you want to stop it. If you decide not to give the interview or not to answer a question, no harm will come to you, and there will be no effect on your access to health services in the future.

*Mahojiano yatafanyika ndani au nje ya nyumba yako pahali ambapo hatutasikika na mtu mwingine. Mahojiano yatachukua muda wa kama dakika 45 hivi kukamilika. Nitakuuliza maswali kuhusu nyumba yako/yenu, upangaji wa uzazi, uamuzi kuhusu kutafuta huduma za afya na pia uamuzi kuhusu kiwango cha familia.*

*Waweza kuamua kukataa kushiriki, ama kutojibu swali lolote kwa sababu yoyote ile. Waweza kusimamisha majadiliano wakati wowote kwa kunieleza kuwa wataka kuyasimamisha. Ukiamua kutoshiriki majadiliano ama kutojibu swali lolote, hakuna madhara yatakayotokea kwako, wala hakutakuwa na adhari kwako kuhusu kupata huduma za afya kwa siku zijazo.*

### Confidentiality

Your answers will not be shared with anyone outside this research project. Your name will not appear on the survey. We will not share answers with community members, health providers, family or anyone else. At the end of the study, we will put all the answers together and make a report. Once the study is finished, the completed surveys will be destroyed.

*Majibu yako hayataambiwa mtu mwingine kando na watafiti wanaoshiriki katika mradi huu. Jina lako halitachapishwa katika utafiti huu. Hatutatoa majibu yako kwa watu wa jamii hii, wahudumu wa afya, watu wa familia yako wala mtu mwingine yeyote. Mwisho wa utafiti huu tutayaweka majibu yote pamoja na kuandika ripoti. Utafiti ukisha malizika, majibu yote yataharibiwa.*

### How many people will take part in this study

If you decide to be interviewed, you will be one of about 4000 men from urban areas of Kenya who will be interviewed.

*Ukikubali kushiriki majadiliano haya, utakua mmoja kati ya wanaume 4,000 katika maeneo ya miji ya Kenya ambao watahojiwa.*

### Benefits

Research helps society by providing new knowledge. You may not benefit directly from this survey. However, your answers will be important for planning better programs to make sure that men and women can access the health care they need.

*Utafiti husaidia jamii kwa kutoa ufahamu mpya. Huenda usifaidike kibinafsi kutokana na utafiti huu. Hata hivyo majibu yako yatakua muhimu katika kupanga miradi bora zaidi ili kuhakikisha kwamba wanawake na wanaume wanapata huduma za afya wanazo zihitaji*

### Risks and Discomforts

There is the possibility you may feel uncomfortable about a question I ask. If you feel uncomfortable about any of the questions, you do not have to answer them. I can skip those questions and go on to the next section. You can end the interview at any time. There is also the possibility that someone may approach us during the interview to find out what we are discussing. We intend to do this interview in private, if someone approaches us, we will stop the interview until we can continue in private. Some questions may not apply to you, but the interviewer must ask the same questions of everyone.

*Kuna uwezekano kuwa utahisi kutopendezwa na maswali fulani nitakayokuuliza. Ukihisi kutopendezwa kuhusu maswali yoyote, siyo lazima uyajibu. Ninaweza kuyawacha maswali hayo na kuanza sehemu nyingine. Unaweza kutamatisha majadiliano wakati wowote. Kuna uwezekano pia mtu mwingine aweza kuja wakati tunapoendelea na majadiliano kutaka kujua ni nini tunachojadiliana. Tunatumaini kufanya majadiliano haya kwa siri, na ikiwa mtu atatukaribia, tutaacha majadiliano hadi tutakapo baki wawili. Maswali mengine yaweza kuwa hayakuhusu lakini ni lazima kuuliza maswali sawa kwa kila mtu kwa sababu ya utafiti*

### Costs and Payment for Participation

There are no costs for being in this study. You will not receive any compensation for taking part in this study. Haikugharimu chochote kushiriki katika utafiti huu. Hutapokea malipo yoyote kwa kushiriki katika utafiti huu.

### Questions / Your rights as Participants

This study has been approved by the Kenya Medical Research Institute, and the University of North Carolina (USA). If you have any questions about this study or the results, you can contact the following: the country study coordinator at the Kenyan National Bureau of Statistics Mr Christopher Ndayara Omolo at 020 2244079; the study coordinator at APHRC Mr Paul Kuria 020 2720400; The Institutional Review Board at the University of North Carolina at +1 919-966-3113; The Secretary, National Ethics Review Committee at Kenya Medical Research Institute at +254 (020) 2722541, 2713349. You have the right to ask, and have answered, any questions you may have about this research. If you have questions or concerns, you should contact the researchers listed above, or ask me before or after the interview. Do you have any questions now?

*Utafiti huu umeidhinishwa na Shirika la Kenya la Utafiti wa Matibabu, na Chuo Kikuu cha North Carolina (Marekani). Kama una maswali yeyote kuhusu utafiti huu ama matokeo yake, unaweza kuwasiliana na wafuatao: Mwelekezi wa utafiti wa Shirika la Kitaifa la Kenya la Takwimu*

Bwana Christopher Ndayara Omolo kwa nambari 020 2244079; Mwelekezi wa utafiti wa shirika la APHRC Bwana Paul Kuria 020 2720400, Katibu wa Kamati ya Kitaifa ya Kuchunga Maadili katika Taasisi ya Kenya ya Utafiti wa Matibabu nambari +254 (020) 2722541, 2713349. ama Bodi ya Kuchunga Taasisi ya Chuo Kikuu cha North Carolina kwa nambari +1 919-966-3113. Una haki ya kuuliza maswali yoyote na kupata majibu yake kuhusiana na utafiti huu. Ikiwa una maswali ama shauku zozote, wasiliana na watafiti walio orodheshwa hapa, ama uniulize mimi maswali kabla au baada ya majadiliano. Je, una maswali sasa?

**Consent**

Now, can you tell me if you agree to participate in this research? If you say yes, it means that you have agreed to be part of the study.

Yes  No

Sasa waweza kuniambia kama unakubali kushiriki katika utafiti huu? Ukisema ndiyo, inamaanisha kuwa umekubali kushiriki katika utafiti huu.

Ndio  La

Would you like a copy of this document?

Yes  No

Je, wataka nakala ya stakabadhi hii?

Ndio  La

And how many daughters are alive but not living with you?</p> <p><i>Ni wavulana wangapi walio hai lakini hawaishi pamoja nawe? Ni wasichana wangapi walio hai lakini hawaishi pamoja nawe?</i></p>	<p>SONS ELSEWHERE..... [ ][ ]</p> <p>DAUGHTERS ELSEWHERE... [ ][ ]</p>	
Q206	<p>Have you ever fathered a son or a daughter who was born alive but later died?</p> <p><i>Je, umewahi kupata mtoto mvulana au msichana ambaye alizaliwa akiwa hai lakini akaaga dunia baadaye?</i></p> <p>IF NO, PROBE: Any baby who cried or showed signs of life but did not survive?</p> <p><b>ULIZA:</b> <i>Kuna mtoto yeyote ambaye alilia ama kuonyesha dalili zozote za uhai lakini hakuishi?</i></p>	<p>YES.....1</p> <p>NO..... 2</p> <p>DON'T KNOW..... 8</p>	
Q207	<p>CHECK Q206: IF "NO" OR 'DON'T KNOW' ABOVE, RECORD "00" FOR BOTH SONS AND DAUGHTERS DEAD. THEN SKIP TO Q208. IF "YES" ABOVE, ASK...</p> <p>How many boys have died? And how many girls have died?</p> <p><i>Ni wavulana wangapi waliaga dunia? Ni wasichana wangapi waliaga dunia?</i></p>	<p>BOYS DEAD..... [ ][ ]</p> <p>GIRLS DEAD..... [ ][ ]</p>	
Q208	<p>SUM ANSWERS TO 203, 205, AND 207, AND ENTER TOTAL.</p> <p>IF NONE, RECORD '00'.</p>	<p>TOTAL CHILDREN.....[ ][ ]</p>	

Q209 CHECK Q208:		HAS A CHILD OR CHILDREN <input type="checkbox"/>		HAS NOT HAD ANY CHILDREN <input type="checkbox"/> →		Q214	
Q210	How old were you when your first child was born? <i>Ulikua na miaka mingapi wakati mtoto wako wa kwanza alipozaliwa?</i>  (AGE IN COMPLETED YEARS)	AGE IN YEARS.....[ ][ ] DON'T KNOW/REMEMBER.....98					
Q211	How many years old is your youngest living child (last born)? <i>Mtoto wako mchanga zaidi (wa mwisho) ana umri gani?</i>  AGE IN COMPLETED YEARS OR MONTHS; IF LESS THAN 1 YR, RECORD IN MONTHS; IF LESS THAN 1 MONTH, RECORD 00	AGE IN MONTHS.....1 [ ][ ] AGE IN YEARS.....2 [ ][ ] NO LIVING CHILD.....995 DON'T KNOW/REMEMBER.....998					
Q212	At the time that you fathered your youngest child (last born), did you want to have children <u>then</u> , did you want to <u>wait until later</u> , or did you not want to have any (more) children at all?  <i>Wakati ulipopata mtoto wako mchanga zaidi (wa mwisho), ulitaka kupata mtoto wakati huo, ulitaka kungoja hadi baadaye, ama hukutaka mtoto mwingine kamwe?</i>	THEN.....1 → Q214 LATER.....2 NOT AT ALL.....3 → Q214					
Q213	How much longer would you have liked to wait to have your (youngest) child? <i>Ni kwa muda gani zaidi ulikuwa unapendelea kungoja ili upate huyo mtoto wako wa mwisho?</i>  IF ANSWER IS IN MONTHS & YEAR (E.G. 2 ½ YEARS), CONVERT TO MONTHS	MONTHS.....1 [ ][ ] OR YEARS.....2 [ ][ ] OR OTHER (SPECIFY).....996 OR DON'T KNOW.....998					
Q214	Now I would like to ask you about a woman's risk of pregnancy. <i>Sasa nataka kuuliza kuhusu uwezekano wa mwanamke kupata mimba</i> From one menstrual period to the next, are there certain days when a woman is more likely to get pregnant if she has sex?  <i>Kati ya siku za damu ya mwezi za wakati mmoja hadi mwingine, je kuna baadhi za siku ambazo mwanamke ana uwezo zaidi wa kupata mimba akifanya ngono?</i>	YES..... 1 NO..... 2 → Q216 DON'T KNOW . . . . . 8 → Q216					
Q215	Which days are these? Would you say that this time is just before her period begins, during her period, right after her period has ended, or halfway between two periods? <i>Ni siku gani hizi? Ungesema kuwa wakati huu ni kabla tu ya damu ya mwezi kuanza, wakati wa damu ya mwezi, baada tu ya damu ya mwezi kuisha, au siku za katikati ya damu ya mwezi mmoja hadi nyingine?</i>  <b>SINGLE MENTION</b>	JUST BEFORE HER PERIOD BEGINS..... 1 DURING HER PERIOD..... 2 RIGHT AFTER IT ENDS..... 3 HALFWAY BETWEEN TWO PERIODS..... 4 OTHER..... 6 (SPECIFY) DON'T KNOW..... 8					
Q216	Do you think that a woman who is breastfeeding her baby can become pregnant? <i>Je, unafikiri kuwa mwanamke ambaye ananyonyesha mtoto anaweza kupata mimba?</i>	YES . . . . . 1 NO . . . . . 2 DEPENDS..... 3 DON'T KNOW . . . . . 8 → Q301					
Q217	What are the criteria in which breastfeeding is effective as a contraceptive method? <i>Ni kwa kupitia mbinu ipi ambayo kunyonyesha kwaweza kuwa njia mwafaka/kamilifu ya kuzuia kupata mimba?</i>  Anything else? <i>Nini kingine?</i>  MARK ALL THAT APPLY.	EXCLUSIVE BREASTFEEDING (NO SUPPLEMENTS)..... A EXCLUSIVE BREASTFEEDING FOR UP TO 6 MONTHS..... B MENSTRUAL PERIOD HASN'T RETURNED..... C OTHERS..... X (SPECIFY) NONE..... Y DON'T KNOW..... Z					

### SECTION 3: CONTRACEPTION

CHECK FOR PRESENCE OF OTHERS. BEFORE CONTINUING, MAKE EVERY EFFORT TO ENSURE PRIVACY.

Now I would like to talk about family planning, the various ways or methods that a couple/ partners can use to delay or avoid a pregnancy.  
*Sasa ningependa kuongea kuhusu upangaji uzazi, njia tofauti ambazo wapenzi wanaweza kutumia ili kuchelesha au kuzuia kupata mimba.*

INSTRUCTIONS: CIRCLE '1' FOR EACH METHOD MENTIONED SPONTANEOUSLY. THEN PROCEED DOWN COLUMN READING THE NAME AND DESCRIPTION OF EACH METHOD NOT MENTIONED SPONTANEOUSLY. CIRCLE '2' FOR EACH METHOD RECOGNIZED UPON LISTENING TO DESCRIPTION. CIRCLE '3' FOR EACH METHOD NOT MENTIONED NOR RECOGNIZED.

Q301. Which ways or methods have you heard of?  
*Ni njia au mbinu zipi ambazo umewahi kuzisikia?*

PROBE: HAVE YOU HEARD OF ANY OTHER WAYS OR METHODS THAT WOMEN OR MEN CAN USE TO AVOID PREGNANCY?  
*Je umewahi kusikia kuhusu mbinu au njia nyingine ambazo wanawake au wanaume wanaweza kutumia ili kuzuia kupata mamba?*

FOR METHODS NOT MENTIONED SPONTANEOUSLY, ASK:  
 Have you ever heard of (METHOD)?  
*Je, umewahi kusikia kuhusu ... (NJIA)?*

Q302. Have you or your partner ever used (METHOD)?

*Umewahi au mpenzi(wapenzi wako) wamewahi kutumia ... (MBINU)*

		Yes, Mentioned Spontaneously	Yes, When Probed	No	
01	<p>FEMALE STERILIZATION/ TUBAL LIGATION                      Women can have a simple operation to avoid having any more children.</p> <p>KUFUNGA UZAZI KWA WANAWAKE  <i>Kufungwa kwa mishipa inayopitisha yai la mama.                      Wanawake wanaweza kufanyiwa upasuaji/oparesheni kuzuia kupata watoto wengine</i></p>	1	2	3 → <b>Next Method</b>	<p>Have you ever had a partner who had an operation to avoid having any more children?  <i>Umewahi kuwa na mpenzi ambaye amefungwa mishipa inayopitisha yai la mama ili kuzuia kupata watoto wengine?</i></p> <p>YES..... 1                      NO..... 2</p>
02	<p>MALE STERILIZATION/VASECTOMY Men can have a simple operation to avoid having any more children.</p> <p>KUFUNGWA UZAZI KWA WANAUME  <i>Wanaume wanaweza kufanyiwa upasuaji/oparesheni ndogo kuzuia kupata watoto.</i></p>	1	2	3 → <b>Next Method</b>	<p>Have you ever had an operation to avoid having any more children?  <i>Je umewahi kufanyiwa upasuaji ili kuzuia kupata watoto?</i></p> <p>YES..... 1                      NO..... 2</p>
03	<p>DAILY PILL Women can take a pill every day to avoid becoming pregnant.  <i>TEMBE ZA KILA SIKU. Wanawake wanaweza kumeza tembe kila siku kuzuia kupata mimba.</i></p>	1	2	3 → <b>Next Method</b>	<p>YES..... 1                      NO..... 2</p>
04	<p>IUCD Women can have a loop or coil placed inside them by a health provider.  <i>IUCD wanawake wanaweza kuwekwa COIL ndani yao na mhudumu wa afya kuzuia mimba.</i></p>	1	2	3 → <b>Next Method</b>	<p>YES..... 1                      NO..... 2</p>

Q301. Which ways or methods have you heard of? <i>Ni njia au mbinu zipi ambazo umewahi kuzisikia?</i>				Q302. Have you or your partner ever used (METHOD)? <i>Umewahi au mpenzi(wapenzi wako) wamehwhahi kutumia (MBINU)</i>			
FOR METHODS NOT MENTIONED SPONTANEOUSLY, ASK: Have you ever heard of (METHOD)? <i>Je, umewahi kusikia kuhusu .....(NJIA)?</i>				Yes, Mentioned Spontaneous	Yes, When Probed	No	
05	INJECTABLES OR INJECTIONS Women can have an injection by a health provider that stops them from becoming pregnant for one or more months. <i>SINDANO, wanawake wanaweza kudungwa sindano na mhudumu wa afya kuzuia kupata mimba kwa mwezi mmoja ama zaidi.</i>	1	2	3 → <b>Next Method</b>	YES..... 1 NO..... 2		
06	IMPLANTS/NORPLANT Women can have a small rod placed in their upper arm by a health provider, which can prevent pregnancy for one to three years. NORPLANT <i>Wanawake wanaweza kuwekewa NORPLANT kwenye sehemu ya juu ya mkono na mhudumu wa afya kuzuia mimba kwa mwaka mmoja hadi miaka mitatu</i>	1	2	3 → <b>Next Method</b>	YES..... 1 NO..... 2		
07	MALE CONDOM Men can put a rubber sheath on their penis before sexual intercourse. <i>KONDOMU/MPIRA WA WANAUUME. wanaume wanaweza visha mpira kwenye uume wao kabla ya kufanya ngono</i>	1	2	3 → <b>Next Method</b>	Have you ever used a condom? <i>Umewahi kutumia kondomu za wanaume</i> YES..... 1 NO..... 2		
08	FEMALE CONDOM Women can place a sheath in their vagina before sexual intercourse. <i>KONDOMU /MPIRA WA WANAWAKE. Wanawake wanaweza visha uke wao mpira kabla ya kufanya ngono.</i>	1	2	3 → <b>Next Method</b>	YES..... 1 NO..... 2		
09	STANDARD DAYS/ SAFE DAYS/ CYCLE BEADS: Every month that a woman is sexually active she can avoid pregnancy by not having sexual intercourse on the days of the month she is most likely to get pregnant. <i>SIKU MAALUM/ SIKU SALAMA: kila mwezi mwanamke anaweza kujizuia kufanya ngono siku zile yuko katika hali ya uwezekano zaidi wa kupata mimba</i>	1	2	3 → <b>Next Method</b>	YES..... 1 NO..... 2		
10	WITHDRAWAL Men can be careful and pull out before climax. <i>KUTOA UUME, wanaume wanaweza kuwa waangalifu na kuchomoa uume wao kabla ya kumwaga mbegu/kufikia kilele.</i>	1	2	3 → <b>Next Method</b>	YES..... 1 NO..... 2		
11	EMERGENCY CONTRACEPTION/MORNING AFTER PILL/ POSTINOR 2 Women can take pills up to five days after sexual intercourse to avoid becoming pregnant <i>EC/ TEMBE ZA DHARURA/ POSTINOR 2 wanawake wanaweza kumeza tembe ya kuzuia mimba kati ya siku ya kwanza hadi ya tano baada ya kufanya ngono.</i>	1	2	3 → <b>Next Method</b>	YES..... 1 NO..... 2		
12	LACTATIONAL AMENORRHEA (LAM) Up to 6 months after childbirth, a woman can use a method that requires that she breastfeeds exclusively (baby does not eat other food) and that her menstrual period has not returned. <i>NJIA YA KUNYONYESHA PEKEE: hadi miezi sita baada ya mtoto kuzaliwa mwanamke anaweza kutumia njia inayombidi kunyonyesa pekee (bila kumlisha mtoto chakula chochote kingine) na kabla damu ya mwezi kurudi.</i>	1	2	3 → <b>Q302</b>	YES..... 1 NO..... 2		

13	Have you heard of any other ways or methods that women or men can use to avoid pregnancy? <i>Je, umesikia njia au mbinu nyingine zozote ambazo mwanamke ama mwanamume anaweza kutumia ili kuzuia kupata mimba?</i>	YES _____ 1 (SPECIFY) NO..... 3	YES..... 1 NO..... 3

Q705	Who decides how the money <u>your wife/partner</u> earns will be used: mainly you, mainly your wife, or you and your wife jointly? <i>Ni nani huamua vile pesa ambazo mkeo/mwenzio anapata zitatumika: ni wewe sana sana, ni mke/mpenzi wako sana sana, ama ni wewe pamoja na mkeo/mpenzi wako?</i>	RESPONDENT ..... 1 WIFE ..... 2 RESPONDENT AND WIFE JOINTLY..... 3 OTHER _____ 6 (SPECIFY)	

Q706. Sometimes in a marriage or a relationship, a man prohibits his wife/partner from doing certain things. Would/do you prohibit your wife from:  <i>Wakati mwingine katika ndoa mume humkataza mkewe kufanya mambo fulani. Wewe unamkataza/ungemkataza mkeo:</i>			
	<b>YES</b>	<b>NO</b>	<b>DON'T KNOW</b>
a. Working outside the home? <i>Kufanya kazi nje ya nyumbani?</i>	1	2	8
b. Having visits from people? <i>Kutembelewa na watu?</i>	1	2	8
c. Visiting her friends? <i>Kwenda kutembelea marafiki zake?</i>	1	2	8
d. Visiting her family? <i>Kwenda kuwatembelea jamaa zake?</i>	1	2	8
e. Using contraceptives? <i>Kutumia njia za kuzuia kupata mimba?</i>	1	2	8
f. Using a mobile phone? <i>Kutumia simu ya rununu/mkono?</i>	1	2	8

Q707	<p>In a couple, who do you think should have the greater say in each of the following decisions: the husband, the wife, or both equally:  <i>Kati ya mume na mke ni nani anafaa kuwa na uamuzi zaidi kwa mambo yafuatayo: ni mume, ni mke au wote wana uamuzi sawa:</i></p>	<b>HUSBAND</b>	<b>WIFE</b>	<b>BOTH EQUALLY</b>	<b>DK/DEPENDS</b>	
		a. Making large household purchases? <i>Kununua vitu vya gharama kubwa vya nyumba?</i>	1	2	3	8
		b. Making small daily household purchases? <i>Kununua vitu vidogo vidogo vya kila siku vya nyumbani?</i>	1	2	3	8
		c. Deciding when to visit family, friends, or relatives? <i>Kuamua wakati wa kuwatembelea familia, marafiki au jamaa?</i>	1	2	3	8
		d. Deciding when and where to seek your wife's medical care? <i>Kuamua wakati gani na ni wapi mkeo atapata huduma za afya?</i>	1	2	3	8

Q708	<p>Sometimes a man is annoyed or angered by things that his wife does. In your opinion, is a man justified in hitting or beating his wife in the following situations?  <i>Wakati mwingine mwanamume hukasirishwa na mambo ambayo mkewe hufanya. Kwa maoni yako, ni sawa kwa mwanaume kumpiga mkewe wakati mambo kama yafuatayo yanapofanyika?</i></p>	<b>YES</b>	<b>NO</b>	<b>DON'T KNOW</b>	
		a. If she goes out without telling him? <i>Akienda nje kutembea bila kumwambia?</i>	1	2	8
		b. If she neglects the house or the children? <i>Akipuza kutunza nyumba ama watoto?</i>	1	2	8
		c. If she argues with him? <i>Anapobishana na mume wake?</i>	1	2	8
		d. If she refuses to have sex with him? <i>Akikataa kufanya ngono naye?</i>	1	2	8
		e. If she cooks the food improperly? <i>Akipika chakula vibaya?</i>	1	2	8
		f. If he suspects her of being unfaithful? <i>Akishuku kuwa bibi si mwaminifu?</i>	1	2	8
		g. If she refuses to have another child? <i>Akikataa kumzalika mtoto mwingine?</i>	1	2	8

Now I am going to read some statements to you about relationships and children. For each statement, please tell me your opinion as to whether you strongly agree, somewhat agree, somewhat disagree, or strongly disagree with it.  
*Sasa nitakusomea sentensi kuhusu uhusiano wa mume na mke na wa watoto. Kwa kila sentensi tafadhali nieleze maoni yako iwapo unakubaliana kabisa, unakubaliana, hukubaliani, hukubaliani kabisa na yanayosemwa katika sentensi hizo.*

		<b>Strongly Agree</b> <i>Nakubaliana kabisa</i>	<b>Agree</b> <i>Nakubaliana</i>	<b>Disagree</b> <i>Sikubaliani</i>	<b>Strongly disagree</b> <i>Sikubaliani kabisa</i>
Q709	The husband should be the one to decide whether the couple should use a family planning method. <i>Mume ndiye anafaa kuamua ikiwa yeye na mke wake watatumia njia ya kupanga uzazi.</i>	4	3	2	1
Q710	Couples who practice family planning have a better quality of life than those who do not. <i>Mume na mke wanao tumia njia za kupanga uzazi wana maisha bora kuliko wale ambao hawatumii.</i>	4	3	2	1
Q711	Husbands and wives should discuss family planning. <i>Mume na mke wanafaa kujadiliana kuhusu upangaji wa uzazi.</i>	4	3	2	1
Q712	Men should not allow their wives to use family planning. <i>Wanaume hawafai kuwaruhusu wake zao kutumia njia za kupanga uzazi.</i>	4	3	2	1
Q713	A woman who uses family planning without her husband's knowledge should be punished. <i>Mwanamke anaetumia njia za kupanga uzazi bila mume wake kujua anafaa aadhibiwe.</i>	4	3	2	1
Q714	A woman who has no children is not complete/fulfilled. <i>Mwanamke asiyekuwa na watoto si mkamilifu.</i>	4	3	2	1
Q715	A man who has no children is not complete/fulfilled. <i>Mwanamume asiyekuwa na watoto si mkamilifu.</i>	4	3	2	1
Q716	It is good to have many children because one is not sure who among them will survive to care of the parents at old age. <i>Ni vyema kupata watoto wengi kwa sababu mtu hana uhakika ni yupi atakayeishi ili kuwatunza wazazi wakizeeka.</i>	4	3	2	1
Q717	The number of children a couple will have is for God only to decide. <i>Ni mungu tu atakaye amua idadi ya watoto ambayo mume na mke/wapenzi watapata.</i>	4	3	2	1
Q718	A woman should continue bearing children until she has at least one son. <i>Mwanamke anafaa kuendelea kuzaa watoto hadi angalau apate mtoto mmoja wa kiume.</i>	4	3	2	1
Q719	A woman should continue bearing children until she has at least one daughter. <i>Mwanamke anafaa kuendelea kuzaa watoto hadi angalau apate mtoto mmoja wa kike</i>	4	3	2	1

## Household Head Consent: Household-Based Survey on Family Planning

### Introduction

Hello! My name is \_\_\_\_\_, I am part of a research team working for the Kenya National Bureau of Statistics. We are carrying out research on family planning in urban areas of Kenya. Your participation in this study will help to improve family planning services in this city. We will be asking questions to all women ages 15-49 and men ages 15-59 from this household for this study. We would also like to ask some questions from you about household assets, a list of the people who usually live in the household, and details about the head of the household.

*Are you the head of the household? Are you interested in participating? Please let me tell you more about it. Habari! Jina langu ni \_\_\_\_\_, mimi ni mojawapo ya watafiti wanao fanya kazi na shirika la Kitaifa la Kenya la Takwimu. Tunafanya utafiti kuhusu upangaji wa uzazi katika miji ya Kenya. Kushiriki kwako katika utafiti huu kutasaidia kuimarisha huduma za upangaji wa uzazi katika jiji hili. Tutawauliza maswali wanawake wote kati ya umri wa miaka 15 hadi 49 na wanaume kati ya umri wa miaka 15 hadi 59 wanaoishi katika nyumba hii kwa ajili ya utafiti huu. Pia tungetaka kuuliza kuhusu vitu vilivyoko katika nyumba hii, orodha ya watu ambao kwa kawaida wanaishi hapa na tutataka kujua zaidi kuhusu kiongozi wa nyumba hii.*

*Je wewe ndiye kiongozi au msimamizi wa nyumba hii? Ungependa kushiriki? Ngoja nikuelezee zaidi.*

### Explanation of Procedures

Being part of this study involves answering questions during a short interview that will take about 45 minutes. To join the study is voluntary. You may refuse to participate, or you may stop the interview at any point. If you stop the interview, there will be no effect on the household's access to health services in the future.

*Kushiriki katika utafiti huu kunahitaji kujibu maswali wakati wa majadiliano mafupi ambayo yatachukua kama dakika 45 hivi. Kushiriki kwako ni kwa hiyari. Waweza kukataa kushiriki, ama waweza kusimamisha mahojiano wakati wowote. Ukisimamisha mahojiano, watu wa nyumba hii hawataathirika vyovyote kwa siku zijazo wanapokwenda kupata huduma za afya*

### Confidentiality

Your answers will not be shared with anyone outside the research project. All interviews will be held in private. Your name will not appear on the survey. We will not share your answers with community members, health providers, family or anyone else. At the end of the study, we will put all the answers together and make a report. *Majibu yako hayatajulishwa mtu mwingine kando na watafiti wanaoshiriki katika mradi huu. Majadiliano yote yatafanyika kwa siri. Jina lako halitatumika katika utafiti huu. Hatutatoa majibu yako kwa watu wa jamii hii, wahudumu wa afya, watu wa familia yako wala mtu mwingine yeyote. Mwisho wa utafiti huu tutaweka majibu yote pamoja na tutatoa ripoti.*

In addition to the interview today, we would like to meet with you and other (women/men) of the household twice more to ask you some more questions. We will need to contact you in two years to interview you a second time, and again two years after that to interview you a third time. We would like to interview you three times to see how the circumstances in your life change. So we can find your household again, we need to ask questions on how, where and when to best contact you. We will make every effort to plan the next interview without anyone knowing. Your contact information will be kept in a locked cabinet, and kept apart from your answers to the questions. Once the study is finished, the list of names with your contact information, and the completed questionnaires will be destroyed.

*Kadhali, kando na mahojiano ya leo, tungependa kukuona wewe pamoja na wengine (wanaume/wanawake) wa nyumba hii mara mbili zaidi ili tuwaulize maswali mengine. Tutahitaji kuwasiliana tena baada ya miaka miwili ijayo ili kuwa na majadiliano ya pili, na pia miaka mingine miwili baadaye ili kujadiliana tena kwa mara ya tatu. Tungependa kujadiliana nawe mara tatu ili kuweza kuona vile hali ya maisha yako inavyobadilika.*

*Ili kuweza kuwapata watu wanaoishi hapa kwa mara nyingine, tutahitaji kuuliza maswali kuhusu vipi, wapi na lini tutakavyo weza kuwasiliana nawe. Tutafanya jitihada zote tuwezavyo kupanga majadiliano yatakayofuata bila mtu mwingine kujua. Habari ya jinsi ya kuwasiliana nawe zitafungiwa kwenye kabati, mbali na majibu yote ambayo utatupa. Utafiti huu ukishakamilika, orodha ya majina na habari za mawasiliano na pia majibu yote ya maswali yataharibiwa.*

### Benefits

You may not personally benefit from being in this study, but research helps society by providing new knowledge. The answers to our survey will help us design better programs to improve women's health in Kenya.

*Huenda usifaidike kibinafsi kutokana na utafiti huu, lakini utafiti husaidia jamii kwa kuwapa ujuzi mpya. Majibu tutakayopata kupitia utafiti huu yatausaidia katika kuunda miradi bora zaidi ili kuboresha afya ya kina mama hapa Kenya.*

### Risks and Discomforts

There is the possibility you may feel uncomfortable about a question I ask. If you feel uncomfortable about any of the questions, you do not have to answer them. I can skip those questions and go on to the next section. You can end the interview at any time.

*Kuna uwezekano kuwa utahisi kutopendezwa na swali fulani nitakalo uliza. Ukihisi kutopendezwa kuhusu maswali yoyote, siyo lazima uyajibu. Ninaweza kuruka maswali hayo na kuanza sehemu nyingine. Unaweza kusimamisha majadiliano wakati wowote.*

There is also the possibility that someone may approach us during the interview to find out what we are discussing. We intend to do this interview in private, if someone approaches us, we will stop the interview until we can continue in private. Some questions may not apply to you, but the interviewer must ask the same questions of everyone.

*Kuna uwezekano pia mtu mwingine aweza kuja karibu wakati tunapoendelea na majadiliano kutaka kujua ninini tunachojadiliana. Tuna nia kufanya majadiliano haya kwa siri, na ikiwa mtu atatukaribia, tutaacha majadiliano hadi tutakapo baki wawili. Maswali mengine yaweza kuwa hayakuhusu lakini ni lazima niulize kila mtu maswali yale yale.*

### Costs and Payment

There are no costs for being in this study. You will not receive any money for taking part in this study.

*Haikugharimu chochote kushiriki katika utafiti huu. Hutapokea pesa zozote kwa kushiriki katika utafiti huu.*

### Questions /Your rights as Participants

This study has been approved by the Kenya Medical Research Institute, and the University of North Carolina (USA). If you have any questions about this study or the results, you can contact the following: The study coordinator at the Kenyan National Bureau of Statistics Mr Christopher Ndayara Omolo at 020 2244079; the study coordinator at APHRC Mr Paul Kuria 020 2720400, The Secretary, National Ethics Review Committee at Kenya Medical Research Institute at +254 (020) 2722541, 2713349. or the Institutional Review Board at the University of North Carolina at +1 919-966-3113. You have the right to ask, and have answered, any questions you may have about this research. If you have questions or concerns, you should contact the researchers listed above, or ask me before or after the interview. Do you have any questions now?

*Utafiti huu umeidhinishwa na Shirika la Kenya la Utafiti wa Matibabu, na Chuo Kikuu cha North Carolina (Marekani). Kama una maswali yeyote kuhusu utafiti huu ama matokeo yake, unaweza kuwasiliana na wafuatao: Mwelekezi wa utafiti wa Shirika la Kitaifa la Kenya la Takwimu Bwana Christopher Ndayara Omolo kwa nambari 020 2244079; Mwelekezi wa utafiti wa shirika la APHRC Bwana Paul Kuria 020 2720400, Katibu wa Kamati ya Kitaifa ya Kuchunga Maadili katika Taasisi ya Kenya ya Utafiti wa Matibabu nambari +254 (020) 2722541, 2713349. ama Bodi ya Kuchunga Taasisi ya Chuo Kikuu cha North Carolina kwa nambari +1 919-966-3113. Una haki ya kuuliza maswali yoyote na kupata majibu yake kuhusiana na utafiti huu. Ikiwa una maswali ama shauku zozote, wasiliana na watafiti walio orodheshwa hapa, ama uniulize mimi maswali kabla au baada ya majadiliano. Je, una maswali sasa?*

### Consent

Now, can you tell me if you agree to participate in this research? If you say yes, it means that you have agreed to be part of the study.

Yes No

Sasa waweza kuniambia kama unakubali kushiriki katika utafiti huu? Ukisema ndiyo, inamaanisha kuwa umekubali kushiriki katika utafiti huu.

FOLLOW-UP CONTACTS	
QUESTIONNAIRE NO: [__ __ __ __ __ __ __] (city code 1 digit + cluster code 3 digits + HHH number 3 digits)	
Q44	SURNAME OF RESPONDENT: _____
Q45	FIRST OR GIVEN NAME OF RESPONDENT: _____
Q46	LAST FOUR DIGITS OF ID NUMBER OF RESPONDENT ..... 1. [__ __ __ __] OR PASSPORT NUMBER OF RESPONDENT..... 2 [__ __ __ __] OR ANY OTHER IDENTIFICATION.....3 [__ __ __ __] SPECIFY DON'T HAVE IDENTIFICATION .....99997
Q47	ADDRESS/DESCRIPTION OF HOUSEHOLD: _____ _____
<p>As I mentioned earlier, we would like to follow-up with this household in two years and then again in another 2 years to see what, if anything, has changed according to health and information needs. For this reason, I will be asking for the contact information of people that maybe able to tell us where you and your household are in 2 years and in 4 years in case you move. This information will be kept separate from your responses in a locked cabinet in a secured room where only the primary researcher can assess. Remember you are free to skip any questions that you are uncomfortable providing answers to</p> <p><i>Kama nilivyo ashiria mbeleni, tungependa kuwatembelea tena baada ya miaka miwili kuona kama kutakua na mabadikiko yoyote kulingana na mahitaji ya afya na ya mawasiliano. Kwa sababu hii, nitakuuliza habari za mawasiliano za watu ambao wanaweza kutuambia mahali ambapo watu wa nyumba hii wako baada ya miaka miwili na miaka minne ikiwa mtahama. Habari hizi zitawekwa kando na majibu yako katika kabati lililofungwa katika chumba ambacho ni salama na ambapo ni mtafiti mkuu pekee ndiye anayeweza kufikia.</i></p>	
Q48	What other names are you commonly known by? <i>Ni majina yapi mengine ambayo unajulikana sana nayo?</i>
Q49	Do you have access to a mobile phone OR landline? <i>Una simu ya mkono ama kunayo simu ya waya ambayo tunaweza kutumia kuwasiliana nawe?</i>
Q50	If yes, could you please share with me a mobile phone number/land line for contacting you? <i>Kama ndiyo, tafadhali nipatie nambari ya simu ambayo ninaweza kutumia kuwasiliana nawe?</i>
Q51	Could you also please share with me a secondary mobile phone number or landline number for contacting you? <i>Tafadhali nipatie nambari ya pili ya rununu ama simu ya waya ya kuwasiliana nawe?</i>
Q52	Does your family/household have any plans to move in the next two years? <i>Je, familia/watu wa nyumba hii wana mipango ya kuhama katika miaka miwili ijayo?</i>  <b>IF YES</b> , where does your family plan to move to? <b>KAMA NDIO</b> , Mwapanga kuhamia wapi?

<p>Q53</p>	<p>IF RESPONDENT IS <b>NOT</b> HH HEAD:</p> <p>What is the name and mobile phone number (if possible) of the head of this household?</p> <p><i>Tafadhali nipatie nambari ya simu ya rununu (kama inawezekana) ya kiongozi wa nyumba hii?</i></p>	<p>NAME: _____</p> <p>MOBILE NUMBER: <input type="text" value="0"/>  </p> <p>ENTER LINE NUMBER FROM THE HOUSEHOLD SCHEDULE        </p>
<p>Q54</p>	<p>What is the name and mobile phone number (if possible) of someone else within your household?</p> <p><i>Tafadhali nipe jina na nambari ya simu (kama inawezekana) ya mtu mwingine anayeishi katika nyumba hii ni gani?</i></p>	<p>NAME: _____</p> <p>MOBILE NUMBER: <input type="text" value="0"/>  </p> <p>ENTER LINE NUMBER FROM THE HOUSEHOLD SCHEDULE        </p>
