Tuberculosis surveillance and monitoring in Europe

2021

2019 data

Abstract

With almost 260 000 tuberculosis (TB) cases reported in 2019, TB remains a major public health problem in the WHO European Region, including the countries of the European Union/European Economic Area (EU/EEA). This report provides an overview of the latest TB epidemiological situation and is published jointly by the WHO Regional Office for Europe and the European Centre for Disease Prevention and Control (ECDC). It finds that epidemic patterns and trends vary widely, with the EU/EEA approaching the low incidence level of 9.2 per 100 000 population while the Region has nine out of 30 countries with the highest multidrug-resistant TB burden in the world. Overall, TB mortality and incidence rates have fallen. Despite the notable progress achieved in the fight against TB, countries still face a variety of challenges in reaching the goal to end the TB epidemic in the Region.

Acknowledgements

This report has been published jointly by the European Centre for Disease Prevention and Control (ECDC) and the WHO Regional Office for Europe. The Regional Office developed the overview of the European Region as a whole and validated the figures of the non-European Union/European Economic Area (EU/EEA) countries and areas. ECDC developed the overview of the EU/EEA countries and validated the EU/EEA figures.

Data collection, validation, analysis and overall preparation of the report was coordinated by Giorgi Kuchukhidze (WHO Regional Office for Europe) and Marlena Kaczmarek (ECDC).

Review and production support was provided by Askar Yedilbayev (WHO Regional Office for Europe), Andrei Dadu (WHO Regional Office for Europe), Soudeh Ehsani (WHO Regional Office for Europe), Ogtay Gozalov (WHO Regional Office for Europe), Arax Hovanesyan (freelance consultant), Csaba Ködmön (ECDC) and Marieke J. van der Werf (ECDC).

The report was sent for consultation and review to the operational contact points for epidemiology or national focal points for TB in the EU/EEA countries and TB surveillance correspondents in the non-EU/EEA countries and areas.

The entire report is available online at www.ecdc.europa.eu/en/publications-data/tuberculosis-surveillance-and-monitoring-europe-2021 and www.euro.who.int/tb

ECDC and the WHO Regional Office for Europe would like to thank the nominated operational contact points for TB surveillance from EU/EEA countries and the TB surveillance focal points from the non-EU/EEA countries and areas of the WHO European Region for providing data and valuable comments on this report:

Executive summary

Executive summary

The WHO European Region

The data in this report present tuberculosis (TB) notifications through to the end of 2019, the period just before the global COVID-19 pandemic began. The impact of the pandemic on laboratory, clinical and public health institutions involved in TB surveillance and response has been felt during the data-collection and preparation stages of the report, with several countries and areas requiring more time than usual to submit their 2019 TB data. Several found that it was not possible to report some variables at all or at levels concordant with the past. The European Centre for Disease Prevention and Control (ECDC) and the WHO Regional Office for Europe, in collaboration with Member States and partners, will look carefully at the impact of COVID-19 on TB surveillance to ensure the continuing high standard of European TB data.

Despite the notable progress achieved in the fight against TB in the WHO European Region and the ongoing decline in incidence seen as a result, TB, and its drug-resistant form in particular, still poses a public health threat in most countries and areas within the Region and should not be underestimated.

TB burden

The year 2019 saw a further decrease in TB, with 246 000 incident TB cases (214 000–280 000) estimated in the WHO European Region, corresponding to 26 cases (23–30) per 100 000 population. During the period 2015–2019 the average annual decline in the TB incidence rate was 5.0%, which is the fastest decline among all WHO regions. The cumulative reduction for the period 2015–2019 was 19.0%, indicating that the Region has almost reached the 2020 End TB Strategy milestone to reduce the TB incidence rate in 2020 by 20% against the 2015 baseline, and is on track to achieve the regional action plan target of a 25% reduction in the TB incidence rate.

In 2019, there were an estimated 20 000 TB deaths among HIV-negative people in the European Region, a cumulative 57.0% decrease since 2010 and equivalent to 2.2 deaths per 100 000 population (range 2.1–2.3). The regional mortality decline was 9.4% between 2018 and 2019, which is notably higher than the average global decline in TB mortality (3.7% between 2018 and 2019).

In 2019, there were an estimated 70 000 new cases of rifampicin-resistant and multidrug-resistant TB (RR/MDR-TB) in the Region, with 46 000 estimated among notified bacteriologically confirmed pulmonary TB patients. This represents around 15.0% of the 465 000 global RR/MDR-TB burden. The proportion of RR/MDR-TB among new and previously treated TB cases in the Region also significantly exceeds the global average, with 17.0%

in new and 52.0% in previously treated cases compared to 3.3% and 18.0% respectively.

HIV prevalence in incident TB cases was estimated to be 12.0% in 2019, marking the third year of halted growth after an unprecedented increase from 3.0% to 12.0% during the period 2007–2016. There were an estimated 30 000 HIV-positive TB cases in the Region, with the Russian Federation (56.7%) and Ukraine (26.0%) contributing to the highest burden of coinfection.

TB disease notification and treatment outcomes

Overall, a 20.4% decrease was observed in the notification rates of new and relapse TB cases during the period 2015–2019 (incident TB cases), from 29.2 to 23.2 cases per 100 000 population. In 2019, 215 871 incident TB cases were notified, amounting to 87.8% of the estimated new and relapse cases in the Region.

The percentage of newly notified TB patients tested using WHO-recommended rapid diagnostic tests increased from 45.3% in 2015 to 69.3% in 2019, overachieving the initial target of 30% set in the TB regional action plan, but remaining below the global End TB Strategy target of 90%.

A total of 180 113 patients with pulmonary TB (83.4%) were notified among incident TB cases, 67.0% of which were laboratory-confirmed. Among bacteriologically confirmed pulmonary TB cases, 90.8% were tested for rifampicin resistance.

Overall, 32.2% of pulmonary TB patients who were reported as having been tested for drug susceptibility had RR/MDR-TB. Prevalence of RR/MDR-TB among new and previously treated bacteriologically confirmed pulmonary TB cases was 21.1% and 54.4% respectively.

There has been an increasing trend in extensively drug-resistant TB (XDR-TB) and with 94.5% second-line drug-susceptibility testing (DST) coverage, 22.5% of pulmonary MDR-TB cases had XDR-TB in 2019. In absolute numbers, XDR-TB cases among pulmonary TB cases increased from 955 in 2015 to 7259 in 2019, largely due to the increase in the number of countries and areas reporting on second-line DST data.

Of the new and relapse TB patients notified from countries and areas reporting HIV testing data, 93.5% were screened for HIV. A total of 25 060 TB cases were detected with HIV-positive status, which is 14.5% of those tested, representing some increase compared to the last year (13.0% in 2018).

A total of 18 836 (75.8%) HIV-positive patients are reported to have received antiretroviral therapy (ART). ART coverage

has been increasing over the last five years but is still far below the WHO target of universal ART coverage for TB/HIV coinfecting patients.

Despite universal treatment coverage for TB and RR/MDR-TB patients, the treatment success rate in the Region remains below the respective regional targets of 85% and 75%. The successful treatment outcome for both incident TB and RR/MDR-TB cohorts were 76.5% and 58.6% respectively, which is comparable with the previous year's results.

Conclusions

Analysis of the 2019 TB surveillance data shows that Member States are making good progress. This progress was particularly impressive in terms of efforts to reduce TB mortality and notification (as a proxy of TB incidence) and to increase testing coverage of new and relapse TB patients using WHO-recommended rapid tests, indicating that overall, the Region is on the right track in its efforts to contain the TB epidemic. Most of the high-priority countries have already achieved or are on track to reach the 2020 milestones of the global End TB Strategy and the targets articulated in the TB regional action plan. However, COVID-19 may jeopardize this progress; the impact of the pandemic on TB service delivery and TB notifications has already been documented and reported from a few high TB burden countries (1).

Although there is evidence of slow improvement, the treatment success rates for new and relapse cases and RR/MDR-TB patients are still below regional and global targets. Despite the efforts made, the burden in relation to RR-TB and TB/HIV is still considerable, underlining the need to introduce more innovative and effective approaches to the diagnosis and treatment of TB and MDR-TB.

European Union and European Economic Area countries

Epidemiology and treatment outcome

In 2019, 49 752 cases of TB were reported in 29 European Union and European Economic Area (EU/EEA) countries (Latvia and Liechtenstein did not report any case-based data), resulting in a notification rate of 9.6 per 100 000 population in the EU/EEA. The overall notification rate and the rates in most countries have been decreasing over the last five years.

Of all notified TB cases, 38 267 (76.9%) were newly diagnosed and 33 368 (67.1%) were confirmed by culture, or smear and nucleic acid amplification test. In 2019, adults aged between 25 and 64 years accounted for 65.3% of all new and relapse TB cases, while children under 15 years accounted for 4.1% of all new and relapse TB cases. Romania reported the highest notification rates among children, with 14.1 cases per 100 000 population aged between 0 and 4 years. In 2019, new and relapse TB cases were more frequently reported in males than females, with a male-to-female ratio of 1.8.

Approximately one third (34.5%) of TB cases reported in the EU/EEA in 2019 were of foreign origin, but this proportion was less than 25% in the countries with TB notification rates higher than 10 per 100 000 population (excluding Malta).

Of 24 812 cases with DST results, 834 (3.4%) had MDR-TB. The countries with the highest proportion of MDR-TB cases among cases with DST results (excluding France) were Estonia (21.3%) and Lithuania (17.0%). XDR-TB was reported for 21.9% of 584 MDR-TB cases tested for second-line drug susceptibility. The proportion of XDR-TB cases among pulmonary MDR-TB cases with results for second-line DST has remained between 20.0% and 25.0% since 2015. Lithuania and Romania reported 75.0% of the total XDR-TB cases in 2019.

The number of countries reporting data on HIV coinfection, which had peaked at 23 countries in 2016 and 2017, decreased to 21 in 2018 and again to 19 in 2019. Of the 16 088 TB cases with known HIV status, 502 (3.1%) were reported as HIV-positive.

TB in prisons remains poorly reported. For the 13 EU/EEA countries reporting data, the notification rate was 185 new and relapse TB cases per 100 000 prison population, and prisoners had a relative risk of 15.8 compared to the general population in the same countries.

Of all 42 811 TB cases notified in 2018 with a treatment outcome reported in 2019, 63.7% were treated successfully, 6.7% died and 0.8% experienced treatment failure. Of 937 MDR-TB cases notified in 2017 with a treatment outcome reported in 2019, 45.7% were treated successfully, 15.2% died and 11.0% experienced treatment failure. Treatment success was reported only for 34.9% of XDR-TB cases notified in 2016, while 26.2% of cases were reported to have died and 18.0% experienced treatment failure.

Conclusions

In 2019, 29 of 31 EU/EEA countries reported TB notification data. There was a further decline in the overall TB notification rate (9.6 per 100 000 population), continuing the trend observed since 2002. However, there is significant work ahead to achieve the United Nations Sustainable Development Goal 3 target notification rate at EU/EEA level of 2.4 per 100 000 population by 2030. Reassuringly, the number of reported MDR-TB and XDR-TB cases continued to decline in EU/EEA countries in 2019 and account for a very small proportion of all reported TB cases in 2019.

Across all cohorts, reported treatment success remains well below the WHO targets. Of all TB cases notified in 2018 with a treatment outcome reported in 2019, only 63.7% were treated successfully. Treatment success was lower for MDR-TB cases at 24 months (43.2%) and lower still among XDR-TB cases at 36 months (34.9%), while the proportion of deaths for these cohorts was 15.0% and 26.2%, respectively.

Across the EU/EEA, TB data continue to be incomplete for HIV coinfection, TB in prisons, and for treatment

outcomes. In 2019, there were further declines in the number of countries reporting HIV status and treatment outcomes.

Резюме

Европейский регион ВОЗ

В настоящем докладе представлены данные по регистрации случаев туберкулеза (ТБ) вплоть до конца 2019 г. – периода непосредственно перед началом глобальной пандемии COVID-19. Влияние пандемии на работу лабораторий, клиник и учреждений здравоохранения, которые принимают участие в эпиднадзоре за ТБ и реализации ответных мер, ощущалось на этапах сбора данных и подготовки доклада, когда нескольким странам и регионам требовалось больше времени для представления данных по ТБ за 2019 г., чем обычно. Некоторые страны сообщили о невозможности сбора данных по ряду переменных или в объемах, сопоставимых с объемом прошлых лет. Европейский центр по контролю и профилактике заболеваний (ЕЦКЗ) и Европейское региональное бюро ВОЗ в сотрудничестве с государствами-членами и партнерами внимательно изучают влияние COVID-19 на эпиднадзор за ТБ, чтобы сохранить неизменно высокий стандарт европейских данных по ТБ.

Несмотря на заметный прогресс в борьбе с ТБ в Европейском регионе ВОЗ и, как следствие, стабильное снижение заболеваемости, туберкулез и особенно его лекарственно-устойчивая форма по-прежнему представляют угрозу общественному здоровью в большинстве стран и территорий Региона, и эту угрозу нельзя недооценивать.

Бремя ТБ

В 2019 г. наблюдалось дальнейшее снижение заболеваемости ТБ: расчетное число новых случаев и рецидивов ТБ в Европейском регионе ВОЗ составило 246 000 (214 000–280 000), что соответствует 26 случаям (23–30) на 100 000 населения. В период 2015–2019 гг. заболеваемость туберкулезом снижалась в среднем на 5,0% в год, – это самые быстрые темпы снижения среди всех регионов ВОЗ. Совокупное снижение за период 2015–2019 гг. составило 19,0%, свидетельствуя о том, что Регион почти достиг промежуточного показателя на 2020 г., установленного в Стратегии по ликвидации ТБ (снижение заболеваемости ТБ к 2020 г. на 20% по сравнению с базовым уровнем 2015 г.), и находится на пути к достижению целевого ориентира Регионального плана действий – снижение заболеваемости ТБ на 25%.

Расчетное число смертей от ТБ среди ВИЧ-отрицательных больных в Европейском регионе ВОЗ в 2019 г. составило 20 000, что на 57,0% меньше, чем в 2010 г., и эквивалентно 2,2 случая смерти на 100 000 населения (диапазон 2,1–2,3). Региональное снижение смертности в период с 2018 по 2019 год составило 9,4%, что значительно

выше среднего показателя снижения смертности от ТБ в мире (3,7% в период с 2018 по 2019 г.).

В 2019 г. расчетное число новых случаев ТБ с лекарственной устойчивостью возбудителя к рифампицину и множественной лекарственной устойчивостью (РУ/МЛУ-ТБ) в Регионе составило около 70 000, причем примерно 46 000 из них были выявлены среди больных ТБ легких с бактериологически подтвержденным диагнозом. Это соответствует приблизительно 15,0% от 465 000 случаев РУ/МЛУ-ТБ во всем мире. Доля РУ/МЛУ-ТБ среди новых и ранее леченных случаев ТБ в Регионе также значительно превышает среднемировой показатель: 17,0% среди новых и 52,0% среди ранее леченных случаев, по сравнению с 3,3% и 18,0% соответственно.

Расчетная распространенность ВИЧ-инфекции среди новых случаев и рецидивов ТБ в 2019 г. составила 12,0%; это означает, что данный показатель не увеличился уже три года подряд после беспрецедентного повышения 3,0% до 12,0% в период 2007–2016 гг. Расчетное число ВИЧ-положительных больных ТБ в Регионе составило 30 000, при этом наибольшее бремя сочетанной инфекции приходится на Российскую Федерацию (56,7%) и Украину (26,0%).

Регистрация случаев ТБ и исходы лечения

В целом в период 2015–2019 гг. наблюдалось снижение показателей регистрации новых случаев и рецидивов ТБ на 20,4% – с 29,2 до 23,2 случая на 100 000 населения. В 2019 г. был зарегистрирован 215 871 случай заболевания ТБ, что составляет 87,8% от расчетного числа новых случаев и рецидивов заболевания в Регионе.

Процент впервые выявленных больных ТБ, прошедших тестирование с использованием рекомендованных ВОЗ быстрых диагностических тестов, вырос с 45,3% в 2015 г. до 69,3% в 2019 г., превысив первоначальный целевой показатель – 30%, предусмотренный Региональным планом действий по борьбе с ТБ, но оставаясь ниже целевого ориентира Глобальной стратегии по ликвидации туберкулеза – 90%.

В общей структуре новых случаев и рецидивов ТБ было зарегистрировано 180 113 больных ТБ легких (83,4%), у 67,0% из которых диагноз был подтвержден лабораторно. Среди больных ТБ легких с бактериологически подтвержденным диагнозом 90,8% прошли тестирование на лекарственную устойчивость возбудителя к рифампицину.

В целом 32,2% больных ТБ легких, которые, по отчетным данным, прошли тестирование на лекарственную чувствительность, имели РУ/МЛУ-ТБ. Распространенность

РУ/МЛУ-ТБ среди новых и ранее леченных бактериологически подтвержденных случаев ТБ легких составила 21,1% и 54,4% соответственно.

Наблюдается тенденция к росту числа случаев ТБ с широкой лекарственной устойчивостью (ШЛУ-ТБ); так, на фоне 94,5% охвата тестированием на лекарственную чувствительность (ТЛЧ) к противотуберкулезным препаратам второго ряда в 2019 г. 22,5% больных МЛУ-ТБ легких имели ШЛУ-ТБ. В абсолютных цифрах число случаев ШЛУ-ТБ среди больных ТБ легких выросло с 955 в 2015 г. до 7259 в 2019 г., в основном вследствие увеличения числа стран и территорий, представляющих отчетность о ТЛЧ к препаратам второго ряда.

Девяносто три с половиной процента новых случаев и рецидивов ТБ, зарегистрированных в странах и территориях, представляющих данные о тестировании на ВИЧ-инфекцию, прошли скрининг на ВИЧ. Всего было выявлено 25 060 больных ТБ с ВИЧ-положительным статусом, что составляет 14,5% от числа обследованных. Это несколько превышает аналогичный показатель предыдущего года (13,0% в 2018 г.).

По отчетным данным, общее число ВИЧ-положительных пациентов, получавших антиретровирусную терапию (АРТ), составило 18 836 (75,8%). На протяжении последних пяти лет отмечался рост охвата АРТ, однако он по-прежнему остается значительно ниже целевого показателя ВОЗ – всеобщего охвата АРТ пациентов с сочетанной инфекцией ТБ/ВИЧ.

Несмотря на всеобщий охват лечением больных туберкулезом и РУ/МЛУ-ТБ, показатель успешного лечения в Регионе остается ниже соответствующих региональных целевых ориентиров – 85% и 75% соответственно. В когорте больных ТБ показатель положительных исходов лечения составлял 76,5%, а в когорте больных РУ/МЛУ-ТБ – 58,6%, что сопоставимо с результатами предыдущего года.

Выводы

Анализ данных эпиднадзора за ТБ за 2019 г. показывает, что государствам-членам удалось добиться значительного прогресса, особенно в работе по снижению смертности от ТБ и регистрации случаев (как косвенного показателя заболеваемости ТБ), а также увеличению охвата тестированием впервые выявленных больных ТБ и больных с рецидивом заболевания с использованием рекомендованных ВОЗ экспресс-тестов. Это свидетельствует о том, что в целом Регион находится на правильном пути в своих усилиях по сдерживанию эпидемии ТБ. Большинство стран высокого приоритета уже достигли или близки к достижению промежуточных ориентиров на 2020 г., указанных в Глобальной стратегии по ликвидации ТБ, и целей, сформулированных в Региональном плане действий по борьбе с ТБ. Однако пандемия COVID-19 ставит под угрозу достигнутый прогресс: несколько стран с высоким бременем ТБ уже сообщили о зафиксированных фактах влияния пандемии на оказание противотуберкулезной помощи и регистрацию случаев ТБ (1).

Фактические данные свидетельствуют о медленном улучшении ситуации, однако показатели успешного лечения впервые выявленных больных и больных с рецидивом ТБ, а также пациентов с РУ/МЛУ-ТБ по-прежнему остаются ниже региональных и глобальных целевых ориентиров. Сохранение, несмотря на предпринятые усилия, высокого бремени РУ-ТБ и ТБ/ВИЧ подчеркивает необходимость внедрения более инновационных и эффективных подходов к диагностике и лечению ТБ и МЛУ-ТБ.

Страны Европейского союза и Европейской экономической зоны

Эпидемиология и исходы лечения

В 2019 г. в 29 странах Европейского союза и Европейской экономической зоны (ЕС/ЕЭЗ) было зарегистрировано 49 752 случая ТБ (Латвия и Лихтенштейн не представили данных о случаях заболевания), в результате чего показатель регистрации случаев составил 9,6 на 100 000 населения стран ЕС/ЕЭЗ. На протяжении последних пяти лет отмечалось снижение как общего показателя регистрации случаев, так и соответствующих показателей в большинстве стран.

Из числа всех зарегистрированных случаев ТБ 38 267 (76,9%) были выявлены впервые, и 33 368 (67,1%) – подтверждены культуральным методом или микроскопией мазка мокроты и тестом на амплификацию нуклеиновых кислот. В 2019 г. в структуре общего числа новых случаев и рецидивов ТБ взрослые в возрасте от 25 до 64 лет составили 65,3%, а дети младше 15 лет – 4,1%. Румыния зафиксировала самые высокие показатели регистрации случаев ТБ среди детей: 14,1 случая на 100 000 населения в возрасте от 0 до 4 лет. В 2019 г. новые случаи и рецидивы ТБ чаще регистрировались среди мужчин, чем среди женщин, причем соотношение мужчин и женщин составило 1.8.

Примерно треть (34,5%) больных ТБ, зарегистрированных в странах ЕС/ЕЭЗ в 2019 г., были лицами иностранного происхождения, но в странах с показателем регистрации ТБ выше 10 на 100 000 населения (исключая Мальту) их доля составила менее 25%.

Из 24 812 больных с соответствующими результатами ТЛЧ у 834 (3,4%) был МЛУ-ТБ. Страны с наибольшей долей случаев МЛУ-ТБ (среди больных с соответствующими результатами ТЛЧ) – Литва (17,0%), Франция (100,0%) и Эстония (21,3%). ШЛУ-ТБ был зарегистрирован у 21,9% от 584 больных МЛУ-ТБ, прошедших тестирование на лекарственную чувствительность к препаратам второго ряда. Доля случаев ШЛУ-ТБ среди больных МЛУ-ТБ легких с результатами ТЛЧ к препаратам второго ряда начиная с 2015 г. колеблется в диапазоне от 20,0% до 25,0%. На долю Литвы и Румынии пришлось 75,0% от общего числа случаев ШЛУ-ТБ в 2019 г.

Число стран, представляющих данные отчетности о случаях сочетанной ВИЧ-инфекции, достигшее пика в 2016 и 2017 гг. (23 страны), сократилось до 21 в 2018 г. и до 19 в 2019 г. Из 16 088 случаев ТБ с известным ВИЧ-статусом 502 (3,1%) были зарегистрированы как ВИЧ-положительные.

Представление данных о случаях ТБ в местах лишения свободы носит неудовлетворительный характер. Для 13 стран ЕС/ЕЭЗ, представляющих данные, показатель регистрации случаев составил 185 новых случаев и рецидивов ТБ на 100 000 заключенных, относительный риск развития ТБ у заключенных составил 15,8, по сравнению с аналогичным показателем для населения в целом в тех же странах.

Из 42 811 больных ТБ, зарегистрированных в 2018 г., исход лечения которых был зарегистрирован в 2019 г., у 63,7% лечение было успешным, 6,7% умерли, и у 0,8% лечение было неэффективным. Из 937 больных МЛУ-ТБ, зарегистрированных в 2017 г., исход лечения которых был зарегистрирован в 2019 г., у 45,7% лечение было успешным, 15,2% умерли, и у 11,0% лечение было неэффективным. Успешный исход лечения был зафиксирован лишь у 34,9% больных ШЛУ-ТБ, зарегистрированных в 2016 г., при этом 26,2% больных умерли, и у 18,0% лечение было неэффективным.

Выводы

В 2019 г. 29 из 31 страны ЕС/ЕЭЗ представили отчетные данные о регистрации случаев ТБ. Отмечалось дальнейшее снижение общего показателя регистрации случаев ТБ (9,6 на 100 000 населения), что является продолжением тенденции, наблюдаемой с 2002 г. Однако

нам предстоит проделать значительную работу для достижения к 2030 г. показателя регистрации ТБ в странах ЕС/ЕЭЗ на уровне 2,4 на 100 000 населения, в соответствии с Целью ООН в области устойчивого развития № 3. Обнадёживает то, что в 2019 г. в странах ЕС/ЕЭЗ число зарегистрированных случаев МЛУ-ТБ и ШЛУ-ТБ продолжило снижаться, и они составляли лишь небольшую долю в структуре всех зарегистрированных случаев ТБ.

Показатель успешного лечения во всех когортах пациентов остается существенно ниже целевых показателей ВОЗ. Из всех больных ТБ, зарегистрированных в 2018 г., исход лечения которых был зарегистрирован в 2019 г., только у 63,7% лечение было успешным. Показатель успешного лечения был ниже у больных МЛУ-ТБ через 24 месяца (43,2%) и еще ниже у больных ШЛУ-ТБ через 36 месяцев (34,9%), в то время как доля смертей в этих когортах составила 15,0% и 26,2% соответственно.

Данные по ТБ и сочетанной ВИЧ-инфекции, ТБ в местах лишения свободы и результатах лечения по-прежнему остаются неполными во всех странах ЕС/ЕЭЗ. В 2019 г. число стран, представляющих данные отчетности о ВИЧ-статусе и результатах лечения, еще больше сократилось.

1. Main facts about tuberculosis

1. Main facts about tuberculosis

Tuberculosis (TB) is an infectious disease caused by a group of *Mycobacterium* species called the *Mycobacterium tuberculosis* complex (1). TB ranks among the top-10 causes of death on a global scale (2). Although TB typically affects the lungs (pulmonary TB), it can cause disease in any organ (extrapulmonary TB). TB is transmitted from person to person when, for example, an individual with pulmonary TB expels bacteria into the air by coughing.

Approximately 25% of the world's population is infected with *M. tuberculosis* (3), but only a small proportion of people (≈ 10%) will develop TB disease during their lifetime; the risk is much higher among immunocompromised individuals (such as people infected with HIV).

Sputum-smear microscopy has been the most common initial TB diagnostic method worldwide, but culture remains the gold standard, while the use of rapid molecular testing is increasing.

Standard treatment of non-resistant TB consists of a six-month regimen of four first-line drugs (isoniazid, rifampicin, ethambutol and pyrazinamide), with success rates usually above 85% (4). Multidrug-resistant TB (MDR-TB) and extensively drug-resistant TB (XDR-TB) require longer treatments with more drugs and are associated with lower success rates.

WHO estimated that 10 million people developed TB disease in 2019. Most cases were thought to occur in the WHO South-East Asia Region (44%), the WHO African Region (25%) and the WHO Western Pacific Region (18%). Smaller proportions of cases were estimated for the WHO Eastern Mediterranean Region (8.2%) and the WHO Region of the Americas (2.9%). The WHO European Region accounted for 2.5% of all cases (4).

Overall, this report shows that in the European Union/ European Economic Area (EU/EEA), TB remains a public health issue. Most EU/EEA countries, however, are low-incidence countries (with a notification rate below 10 per 100 000) in which TB predominantly affects vulnerable populations, such as migrants, prison inmates or people coinfecting with HIV.

The overall aim of TB surveillance is to help inform public health action. The annual TB surveillance and monitoring report presents key figures and trends and provides an overview of the TB situation in the EU/EEA and the WHO European Region.

2. Technical note

2. Technical note

Between 1996 and 2007, TB surveillance data from the European Region were collected and analysed annually under the EuroTB project.

Since 1 January 2008, the European Centre for Disease Prevention and Control (ECDC) and the WHO Regional Office for Europe jointly have coordinated the collection and analysis of TB surveillance data in Europe, aiming to ensure data standardization and high quality across the WHO European Region. The underlying standards and definitions have been agreed by leading European experts. The definitions used in this report are in line with the latest WHO revised definitions (1). In the EU/EEA, the reporting follows the EU case definitions (2).

The report covers the 53 countries of the WHO European Region and Liechtenstein. These are collectively referred to as the European Region.

The data presented in the text and figures are augmented by:

- Tables 1–29, plus a summary table
- trends Tables I–XV
- 53 country profiles
- five annexes.

Data published in the report may differ from figures in national and area reports due to variations in reporting periods and the deadlines for data collection. The deadline for updating the data used in this report was 4 October 2020.

2.1 Data reporting and analysis

Designated experts within national surveillance, infectious disease or public health institutes submitted TB surveillance and control programme management data for 2019 electronically to the ECDC–WHO Regional Office for Europe Joint TB Information System via a common portal.³ TB surveillance data from the EU/EEA countries were later submitted to The European Surveillance System (TESSy) platform hosted by ECDC (Annex 1). Surveillance data from non-EU/EEA countries and areas and programme management data from the entire European Region were processed through the WHO Tuberculosis Monitoring and Evaluation (TME) platform in aggregated format. In 2019, 29 out of 31 EU/EEA Member States reported case-based data. All countries and areas in the European Region were also asked to provide updates for 2016, 2017 and 2018 to allow for the exclusion of duplicate cases or those found later

not to have TB, and for the reporting of treatment outcomes in previously notified cases.

The TESSy variable list for collection of the 2019 data (Annex 2) has not undergone changes compared to the previous year.

Reporting completeness (Annexes 3 and 4) varied among countries and areas due to differences in legislation, specifics of surveillance systems and TB case ascertainment. Readers should be cautious when making comparisons across countries and areas, even though the quality and comparability of reported data have improved in recent years and the reporting completeness generally is high in the EU/EEA, with a few exceptions, such as HIV status and drug-susceptibility testing (DST) data.

Estimates of TB disease burden presented in Tables 1, 2, I and II are provided by WHO using a methodology developed by the Global Task Force on TB Impact Measurement. Estimates are updated annually using the latest available data and analytical methods (3). Population denominators were obtained from United Nations Population Division statistics (4) for the calculation of rates in these tables.

For the calculation of notification rates, country/area total population denominators by age group and gender were obtained from Eurostat (5) (25 June 2020) for the EU/EEA countries and from United Nations Population Division statistics for all other countries and areas.

Reported data were analysed using the main epidemiological (time, place, gender, age, patient origin) and case management (history of previous anti-TB treatment, localization of disease, laboratory results, HIV status and treatment outcome) variables. Associations between variables were, if indicated, quantified as relative risk (RR) and their 95% confidence intervals (CI), and results were considered significant if the CI did not include 1.

2.1.1 TB/HIV coinfection

Case-based HIV status for 2019 was reported by Belgium, Bulgaria, Croatia, Cyprus, Czechia, Denmark, Estonia, Greece, Hungary, Iceland, Ireland, Lithuania, Luxembourg, the Netherlands, Norway, Portugal, Romania, Slovakia and Slovenia. The proportion of HIV/TB coinfection was expressed as a percentage of reported TB cases with known HIV status. HIV status had to be available for more than 50% of all TB cases to be considered complete in the country profiles. For the reported new and relapse TB cases with known HIV status in 2019, start or continuation on antiretroviral therapy (ART) was reported by seven EU/EEA Member States.

³ ECDC/WHO Europe Joint Surveillance can be accessed at: <http://www.ecdcwhosurveillance.org/>

2.1.2 Laboratory network performance and drug resistance

Results of DST from initial isolates of *M. tuberculosis* have been collected for isoniazid and rifampicin since the reporting year 1998. EU/EEA countries have also reported susceptibility to ethambutol and streptomycin, with 78.8% of EU/EEA countries reporting the latter for the last six years (2014–2019). Data on second-line drug resistance to amikacin, capreomycin, kanamycin, ciprofloxacin and ofloxacin have been reported via TESSy since 2008 and via the Centralized Information System for Infectious Diseases (CISID)/TME since 2009. Data on ciprofloxacin are no longer collected in TESSy (since 2017), as ciprofloxacin is no longer recommended for treatment of drug-susceptible or drug-resistant TB. Data on resistance to gatifloxacin, levofloxacin and moxifloxacin were added in 2013, bedaquiline and delamanid in 2016 and pyrazinamide in 2017. Case-based information on DST is collected in countries and areas where DST results are linked to TB case notifications (28 in 2019). Where individual DST data are not available, data have been obtained from WHO's TME in aggregated format, when possible and deemed adequate. Information on the organization and laboratory practices for anti-TB DST in the country/area is collected using the TME module of the joint TB surveillance system. From 2019 onwards, when collecting data to report resistance to anti-TB drugs, EU/EEA Member States are required to report the resistance pattern used on initiation of the treatment to TESSy, irrespective of the method used for DST or resistance prediction. Drug-resistance surveillance (DRS) methods vary across countries and areas. Initial DST results may be collected routinely for all culture-positive TB cases notified, or only for cases included in specific surveys or diagnosed in/referred to selected laboratories. DRS data were considered complete if:

- they were collected nation- or area-wide; or
- culture results were available for 90% or more of all cases; and
- more than 50% of all cases were culture-positive; and
- more than 75% of all culture-positive cases had DST results available for isoniazid and rifampicin; and
- at least 95% of the external quality assessment (EQA) results were confirmed by a supranational reference laboratory.

DRS data were not reported or are considered incomplete for Albania, Andorra, Bosnia and Herzegovina, Italy, Georgia, Latvia, Liechtenstein, Monaco, Serbia, Switzerland and Turkmenistan. France reported complete national DRS data only for rifampicin-resistant TB (RR-TB) cases.

EQA systems are essential for ensuring accurate diagnosis of TB and drug-resistant TB. Implementing EQA by organizing regular EQA rounds and identifying training needs is one of the key activities of the European TB Reference Laboratory Network (ERLTB-Net) (6). The EQA test results for 2019 are published in Annex 5.

Percentages of laboratory-confirmed drug-resistant cases were calculated using cases with known DST results (for at least isoniazid and rifampicin) as the denominator. The results of DST for second-line drugs were analysed for MDR-TB cases only.

2.1.3 Treatment outcome monitoring

EU/EEA countries have provided treatment outcome data since the reporting year 2002, through the submission of an updated dataset for cases notified one year prior to the year of reporting. The same applies to MDR-TB and XDR-TB treatment outcome for cases reported two years earlier and additionally, XDR-TB treatment outcome for cases reported three years earlier. As part of the 2020 data call, for 2019 data, outcome data were collected for TB cases reported in 2018, MDR-TB and XDR-TB cases in 2017 and XDR-TB cases in 2016. Non-EU/EEA countries and areas have reported aggregated treatment outcome data following the same principle since 2013, except for XDR-TB treatment outcome for cases registered three years earlier, which is not reported by non-EU/EEA countries and areas.

If enrolment for treatment is taken into account for treatment outcome monitoring (TOM) analysis, two types of TB cases are included: cases enrolled for treatment, and cases with no indication of enrolment for treatment. For countries and areas reporting case-based data, the most recently updated information was used. This may result in denominators differing from the number of notified cases reported in the previous year's report. For countries and areas reporting aggregate outcome data, completeness of cohorts is assessed by comparing the total number of cases included in TOM cohorts with those initially notified as pulmonary and culture- or smear-positive, depending on the type of cohort.

2.1.4 Geographical areas

The following 31 EU/EEA countries are presented separately in tables and in Chapter 3: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czechia, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia (case-based data not reported for 2018 or 2019), Liechtenstein (case-based data not reported for 2019), Lithuania, Luxembourg, Malta, the Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden and the United Kingdom.

The 23 remaining (non-EU/EEA) countries in the WHO European Region are: Albania, Andorra, Armenia, Azerbaijan, Belarus, Bosnia and Herzegovina, Georgia, Israel, Kazakhstan, Kyrgyzstan, Monaco, Montenegro, North Macedonia, the Republic of Moldova, the Russian Federation, San Marino, Serbia, Switzerland, Tajikistan, Turkey, Turkmenistan, Ukraine and Uzbekistan.

Data from Serbia include TB cases reported from Kosovo⁴ and these are also stratified in tables to reflect United Nations Security Council Resolution 1244 (1999).

⁴ All references to Kosovo in this document should be understood to be in the context of the United Nations Security Council resolution 1244 (1999).

Data from the 18 high-priority countries (HPCs) identified in the *Plan to stop TB in 18 high-priority countries in the WHO European Region, 2007–2015* (7) are presented in italics and as subtotals alongside the subtotals for the EU/EEA countries and non-EU/EEA countries and areas. The 18 HPCs in the WHO European Region are: Armenia, Azerbaijan, Belarus, Bulgaria, Estonia, Georgia, Kazakhstan, Kyrgyzstan, Latvia (did not report case-based data for 2018 or 2019), Lithuania, the Republic of Moldova, Romania, the Russian Federation, Tajikistan, Turkey, Turkmenistan, Ukraine and Uzbekistan.

TB notifications from France include overseas territories. TB notifications from Greenland are not included in the report.

2.2 Definitions

2.2.1 TB case definition for surveillance

Information from EU/EEA countries was collected to enable the classification of cases according to the case definition approved by EU Member States and published by the European Commission (2). This classifies cases as “possible”, “probable” or “confirmed”. Possible cases meet clinical criteria only. Probable cases meet the clinical criteria as well as at least one of the laboratory criteria for a probable case: detection of acid-fast bacilli (AFB) by microscopy; detection of *M. tuberculosis* complex by nucleic acid amplification testing; or histological appearance of granulomata. Confirmed cases require isolation of *M. tuberculosis* complex by culture or detection of both AFB by microscopy and *M. tuberculosis* complex by nucleic acid amplification testing, in addition to meeting clinical criteria.

Data from all countries and areas in the European Region also follow the WHO-recommended definitions, 2013 revision (1). They define a “case of tuberculosis” as a patient in whom TB has been confirmed by bacteriology or diagnosed by a clinician. A “bacteriologically confirmed TB case” is one from whom a biological specimen is positive by smear microscopy, culture or WHO-recommended rapid diagnostics (WRD) such as Xpert MTB/RIF. A “clinically diagnosed TB case” is one that does not fulfil the criteria for bacteriological confirmation, but has been diagnosed with active TB by a clinician or other medical practitioner who has decided to give the patient a full course of TB treatment.

Cases discovered postmortem as having gross pathological findings consistent with active TB that would have indicated anti-TB treatment, had the patient been diagnosed before dying, also fit the clinical criteria and are included.

2.2.2 Previous anti-TB treatment status

New cases have never been treated for TB or have taken anti-TB drugs for less than one month. For EU/EEA countries, cases diagnosed before 1951 are analysed as new cases.

Previously treated patients have received one month or more of anti-TB drugs in the past. They are further classified by the outcome of their most recent course of treatment as follows:

- **relapse:** patients have previously been treated for TB, were declared cured or to have completed their treatment at the end of their most recent course of treatment, and are now diagnosed with a recurrent episode of TB (either a true relapse or a new episode of TB caused by reinfection);
- **treatment after failure:** patients who have previously been treated for TB and whose treatment failed at the end of their most recent course of treatment;
- **treatment after loss to follow up:** patients have previously been treated for TB and were declared lost to follow up at the end of their most recent course of treatment (these were previously classified as “treatment after default”); and
- **other previous treatment:** patients who have previously been treated for TB but whose outcome after their most recent course of treatment is unknown or undocumented.

Patients with an unknown previous TB treatment history do not fit any of the categories listed above.

New and relapse cases of TB are **incident TB cases**.

2.2.3 Site of disease

Pulmonary TB refers to any bacteriologically confirmed or clinically diagnosed case of TB involving the lung parenchyma or the tracheobronchial tree (laryngeal TB is classified as pulmonary). A patient with both pulmonary and extrapulmonary TB should be classified as a case of pulmonary TB.

Extrapulmonary TB refers to any bacteriologically confirmed or clinically diagnosed case of TB involving organs or anatomical sites other than the lungs (such as pleura, lymph nodes, abdomen, genitourinary tract, skin, joints and bones, or meninges).

2.2.4 Notes on the definition

The above TB case definition, and the definition of previous anti-TB treatment status and site of disease, are in accordance with the European Commission’s approved definitions for TB surveillance.

All possible, probable and confirmed cases are reported to the joint European surveillance database. For countries and areas with laboratory-based reporting where no clinical information is available, laboratory-confirmed cases should be reported.

Cases should be notified only once in a given 12-month period, but a case should be reported again if the diagnosis of confirmed TB is made following completion of anti-TB treatment (relapse), even if this occurs within 12 months of reporting the initial disease episode.

Cases that have never been treated are commonly referred to as new cases, although this term should not be considered to indicate incidence in the strict epidemiological sense.

Among re-treated cases, relapse cases are included in notifications from all countries and areas, whereas cases re-treated after failure or loss to follow up and chronic cases are not included or further defined by Belgium, Cyprus, Denmark, France, Luxembourg, Malta, Norway, Spain and the United Kingdom.

DST data were analysed for laboratory-confirmed cases.

2.2.5 Origin of cases

The geographic origin of a TB case is classified according to the place of birth of a person with TB disease (born in the country/born outside of the country) for Bulgaria, Croatia, Cyprus, Czechia, Denmark, Estonia, Finland, France, Germany, Iceland, Ireland, Israel, Italy, Kyrgyzstan, Latvia, Liechtenstein, Lithuania, Luxembourg, Malta, the Netherlands, North Macedonia, Norway, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Tajikistan, Turkey, the United Kingdom and Uzbekistan. For Albania, Andorra, Armenia, Austria, Belarus, Belgium, Bosnia and Herzegovina, Georgia, Greece, Hungary, Kazakhstan, Montenegro, Poland, the Republic of Moldova, the Russian Federation, Serbia, Turkmenistan and Ukraine, origin is classified according to citizenship (citizen/non-citizen). Azerbaijan, Georgia, Kyrgyzstan, Monaco and Turkmenistan did not report information on origin. In Denmark, the birthplace of the parents is also used to classify origin (similarly, for cases born in the Netherlands the birthplace of parents is also notified for case-management purposes). The country of origin is included in case-based data.

The term “native” as used in this report refers to cases born in, or having the citizenship (nationality) of, the reporting country. “Foreign origin” refers to cases born in (or citizens of) a country different to the reporting country.

2.2.6 Drug resistance

Resistance among cases never treated (new TB cases) indicates primary drug resistance due to infection with resistant bacilli.

Resistance among cases previously treated usually indicates acquired drug resistance emerging during treatment following selection of drug-resistant mutant bacilli. It can also result from exogenous reinfection with resistant bacilli.

Multidrug resistance (MDR) refers to resistance to at least isoniazid and rifampicin.

Extensive drug resistance (XDR) refers to resistance to: (i) isoniazid and rifampicin (that is, MDR); (ii) a fluoroquinolone; and (iii) one or more of the following injectable drugs: amikacin, capreomycin or kanamycin (1).

Rifampicin resistance refers to resistance to rifampicin detected using phenotypic or genotypic methods, with or without resistance to other anti-TB drugs. This includes any resistance to rifampicin, whether monoresistance, MDR, polydrug resistance or XDR.

2.2.7 Treatment outcome

2.2.7.1 Cohorts

A cohort is defined as all TB cases notified in the calendar year of interest, after exclusion of cases with a final diagnosis other than TB, or cases found to have been reported more than once.

In accordance with the WHO treatment outcome definitions (1), this report distinguishes between two types of cases:

- patients treated for drug-susceptible TB; and
- patients treated for RR-TB; for non-EU/EEA countries and areas, this includes those placed on second-line treatment (defined as combination chemotherapy for drug-resistant TB).

The two groups are mutually exclusive. For EU/EEA countries, the case types are based on DST results. Any patient reported as having RR-TB is assumed to be on second-line treatment and is excluded from the drug-susceptible TB outcome cohort.

2.2.7.2 Period of observation

All cases are observed until the first outcome assessment up to a maximum of 12 months after the start of treatment. For MDR-TB cases in EU/EEA countries, treatment outcome after 24 months should be reported if treatment lasts longer than 12 months and the reported 12-month outcome is coded as “still on treatment”.⁵ For XDR-TB cases in EU/EEA countries, treatment outcome after 36 months should be reported if treatment lasts longer than 24 months and the reported 12-month and 24-month outcomes are coded as “still on treatment”.⁶ Non-EU/EEA countries and areas evaluate treatment outcomes according to the WHO definition.

2.2.7.3 Treatment outcome categories

All outcome categories but one apply to the entire Region and follow the WHO recommendations in *Definitions and reporting framework for tuberculosis – 2013 revision (1)*. The additional category “still on treatment” applies only to the EU/EEA Member States. The categories are as follows.

Cured is a pulmonary TB patient with bacteriologically confirmed TB at the beginning of treatment who was smear- or culture-negative in the last month of treatment and on at least one previous occasion.

Cured of MDR-TB is treatment completed as recommended under national/area policy without evidence of failure, AND three or more consecutive cultures taken at least 30 days apart are negative after the intensive phase.

Treatment completed is treatment completed as recommended under national/area policy but does not meet the criteria to be classified as cure or treatment failure.

⁵ The degree of adherence to the 12-month limit is unknown, and a number of countries are known to exceed it.

⁶ The degree of adherence to the 24-month limit is unknown.

Treatment failed is a TB patient whose sputum smear or culture is positive at month five or later during treatment.

Treatment failed for MDR-TB case is treatment terminated or the need for permanent regimen change of at least two anti-TB drugs because of:

- lack of conversion by the end of the intensive phase; or
- bacteriological reversion in the continuation phase after conversion to negative; or
- evidence of additional acquired resistance to fluoroquinolones or second-line injectable drugs; or
- adverse drug reactions.

Died is a TB patient who dies for any reason before starting, or during the course of, treatment.

Lost to follow up is a TB patient who did not start treatment or whose treatment was interrupted for two consecutive months or more (defined in previous reports as “defaulted”).

Still on treatment is:⁷

- a patient reported as still on treatment at 12 months without any other outcome during treatment; or
- a patient reported as still on treatment at 12 months and still on treatment at 24 months without any other outcome.

Not evaluated is a TB patient for whom no treatment outcome is assigned; this includes cases “transferred out” to another treatment unit and cases for whom the treatment outcome is unknown to the reporting unit.

In this report, **success** is the sum of “cured” and “treatment completed”.

⁷ This definition is applicable to EU/EEA countries only.

3. Commentary

3.1 The WHO European Region

3.1.1 TB burden estimates (incidence and mortality, HIV and MDR)

An estimated 246 000 new and relapse TB cases (range 214 000–280 000) occurred in countries and areas of the WHO European Region in 2019, equivalent to an average incidence of 26 cases (23–30) per 100 000 population. This represents about 2.5% of the total burden of TB in the world.

The absolute number of incident TB cases in the WHO European Region fell by 13 000 in 2019 compared to the previous year. About 83% of the estimated TB cases in the Region occur in the 18 HPCs, where estimated TB incidence was 50 cases per 100 000 population – almost five times higher than the EU/EEA average. The six countries with the absolute highest number of incident TB cases over 10 000 were the Russian Federation (73 000), Ukraine (34 000), Uzbekistan (22 000), Romania (13 000), Turkey (13 000) and Kazakhstan (13 000). The number relative to population (incidence rate) was highest in Kyrgyzstan (110 per 100 000 population), followed by Tajikistan (83), the Republic of Moldova (80), Ukraine (77) and Georgia (74).

The estimated number of TB cases in the Region has been decreasing consistently since 2000. During the period 2010–2019, the average annual decline in the TB incidence rate was 5.0%, with 5.3% between 2018 and 2019, which is notably higher than the global rate of decline for TB incidence (2.3%) and the fastest decline in the world compared to other regions (1). The cumulative reduction for the period 2015–2019 was 19.0%, indicating that the Region has almost reached the 2020 End TB Strategy milestone to reduce the TB incidence rate in 2020 by 20% against the 2015 baseline, and is on track to achieve the regional action plan target of a 25% reduction in the TB incidence rate. It should nevertheless be emphasized that all the HPCs in the Region have also experienced a decline in the TB incidence rate. During the period 2010–2019, the HPCs with the highest annual rate of decline were Armenia (–9.0%), Belarus (–9.0%), Kazakhstan (–8.0%), Estonia (–7.0%) and Latvia (–7.0%).

There were an estimated 20 000 TB deaths among HIV-negative people in the European Region in 2019, equivalent to 2.2 deaths per 100 000 population (range 2.1–2.3). Considerable variation was seen across the Region, ranging from less than one TB death per 100 000 population in western European countries up to 10 per 100 000 in HPCs. The TB mortality rate was highest in Turkmenistan (10.0 deaths per 100 000), followed by Tajikistan (7.9) and Ukraine (7.3). Together, the 18 HPCs accounted for over 88% of TB deaths in the Region.

Between 2010 and 2019, the TB mortality rate at regional level fell cumulatively by 56.0%, from 5.0 to 2.2 deaths per 100 000 population (Table 1), which on average is a decline of 9.0% per year. This decline was 9.4% between 2018 and 2019, which is notably higher than the global rate of decline for TB mortality (3.7% between 2018 and 2019). With a cumulative reduction of 33.3% between 2015 and 2019, the Region is on track to reach the End TB Strategy milestone of a 35% reduction in the total number of TB deaths between 2015 and 2020 (1).

An estimated 12.0% (range 7.8%–18.0%) of incident TB cases in 2019 were coinfecting with HIV (Table 2). The proportion of TB cases coinfecting with HIV was highest in the Russian Federation (23.0%), Turkmenistan (23.0%) and Ukraine (23.0%), followed by Estonia (12.0%) and the Republic of Moldova (11.0%). The top five countries with the highest absolute number of TB/HIV coinfection cases were the Russian Federation (17 000) and Ukraine (7 800), amounting to 82.7% of the total number of cases, followed by Uzbekistan (880), Kazakhstan (680) and Turkmenistan (610).

Nine out of the 30 countries with the highest MDR-TB burden in the world are in the WHO European Region.⁹ In 2019, there were an estimated 46 000 incident cases of rifampicin-resistant and multidrug-resistant TB (RR/MDR-TB) in the WHO European Region among notified bacteriologically confirmed pulmonary TB cases, with MDR-TB accounting for 86%.

An estimated 17% (95% CI: 16–18%) of newly diagnosed patients and 52% (95% CI: 45–59%) of previously treated patients had RR/MDR-TB. If all TB patients were tested for drug resistance to rifampicin and isoniazid, it is estimated that around 70 000 (range 55 000–87 000) RR/MDR-TB cases would be detected.

3.1.2 TB notification and trends

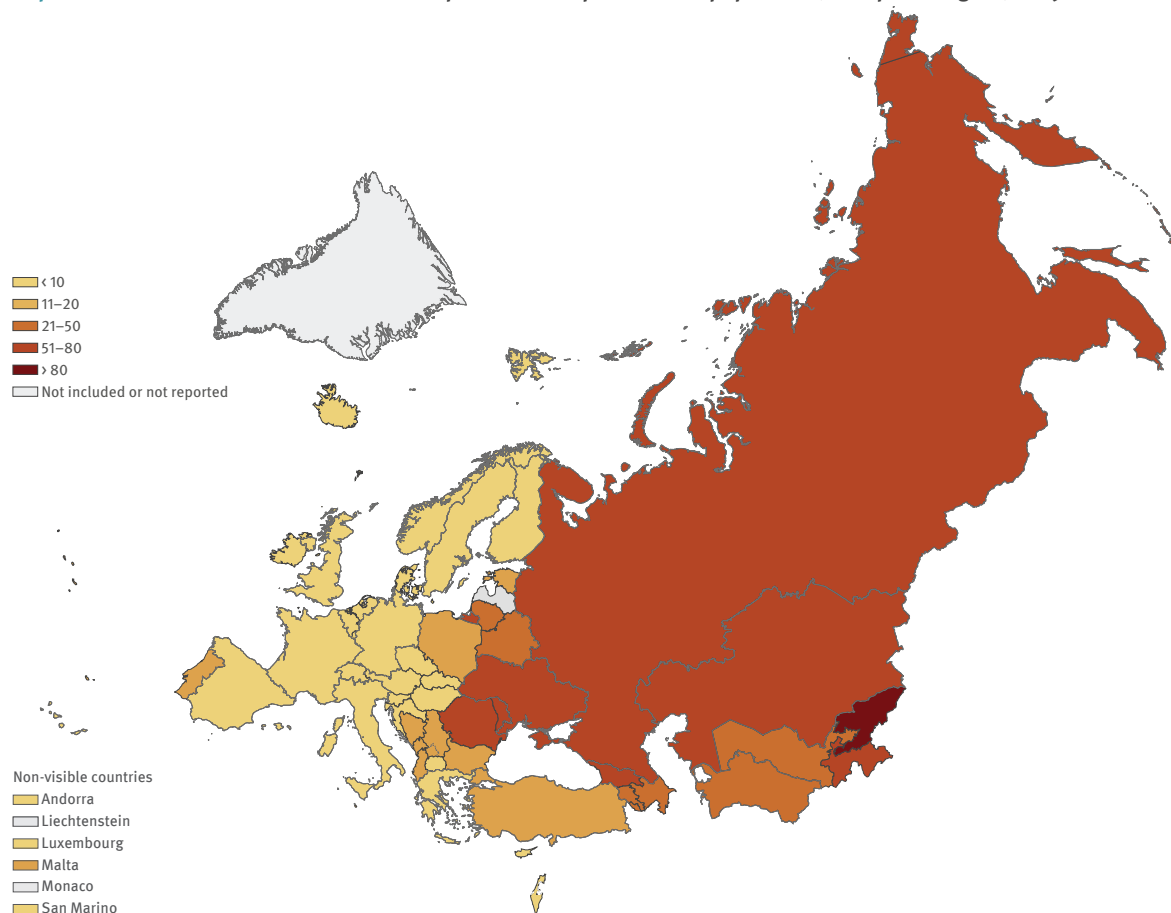

In 2019, 259 946 TB patients were reported from 51 countries and areas¹⁰ in the WHO European Region, 215 871 of which were new or relapse cases or had an unknown previous treatment history (Table 3 and 4). This represents 83.0% of all TB cases notified in 2019.

The notification rate of new and relapse cases varies widely among countries and areas, from zero (San Marino) to 95.7 (Kyrgyzstan) per 100 000 population (Map 1 and Table 4).

Thirty-seven countries, all located in the western and central part of the Region and mostly high-income

⁹ The top-10 countries with the highest global MDR-TB burden (in alphabetical order) are: Azerbaijan, Belarus, Kazakhstan, Kyrgyzstan, the Republic of Moldova, the Russian Federation, Somalia, Tajikistan, Ukraine and Uzbekistan.

¹⁰ Latvia, Liechtenstein and Monaco did not report and San Marino reported zero cases in 2019.

Map 1. TB notification rates of new and relapse TB cases per 100 000 population, European Region, 2019

countries, had low notification of new and relapse cases (less than 20 cases per 100 000) in 2019. Six reported new or relapse case rates of between 20 and 50 per 100 000 population and eight reported over 50 cases per 100 000 population: Kyrgyzstan (95.7), Republic of Moldova (69.5), Kazakhstan (67.4), Tajikistan (61.7), Ukraine (57.7), Romania (57.1), Georgia (54.3) and the Russian Federation (50.3). New and relapse case notifications in the 18 HPCs account for about 83% of the regional burden. The largest proportion of new and relapse cases (73 328, or 34.0%) comes from the Russian Federation, even though the Russian Federation accounts for only approximately 16% of the Region's population. All HPCs rates continue to show a decreasing trend compared to the previous year.

During the period 2015–2019, an overall downward trend of 20.5% was observed in the notification of incident TB cases, from 29.2 to 23.2 cases per 100 000 population (Table 4). This trend reflects a genuine reduction in the spread of the disease, significantly influenced by the decrease in notification rates in the Region's 18 HPCs, from 55.7 to 43.9 per 100 000 population. The notification rate of new and relapse cases in the 18 HPCs is almost twice as high as for the Region overall (43.9 cases per 100 000, compared to 23.2 for the Region) and almost five times higher than the rate in the EU/EEA (9.2 cases per 100 000 population) (Fig. 3.1.1).

3.1.3 Previous treatment history

In 2019, previously treated cases represented 9.7% and 33.4% in the EU/EEA and non-EU/EEA, respectively (Table 5). The average in the 18 HPCs was 32.8%, which is above the pan-European average of 28.8%. Previously treated cases accounted for 15% or more of all TB cases in 15 countries: Azerbaijan (44.7%), the Russian Federation (41.8%), Turkmenistan (33.6%), Kazakhstan (33.1%), Belarus (32.8%), the Republic of Moldova (31.2%), Ukraine (27.7%), Kyrgyzstan (27.6%), Uzbekistan (22.7%), Georgia (22.6%), Romania (19.7%), Armenia (19.1%), Lithuania (17.3%), Estonia (16.0%) and Slovakia (15.9%). Reasons for the high percentage of previously treated cases include clinical failure or poor treatment adherence in previous treatment episodes, and possible re-infection and misclassification during the current treatment episode.

3.1.4 Disease localization

Pulmonary localization was notified in 83.4% of the incident TB cases in the Region in 2019 (Table 7). The proportion of patients with pulmonary localization in the non-EU/EEA countries and areas was higher than in the EU/EEA. Extrapulmonary TB was notified on average for 16.6% of all incident TB cases in the Region. Eleven countries reported more than 30% of their TB cases having extrapulmonary localization: Finland, France, Iceland, the

Fig. 3.1.1. Trend in TB notification rate per 100 000, WHO European Region, between 2015 and 2019

Netherlands, Norway, Sweden, Switzerland, Tajikistan, Turkey, the United Kingdom and Uzbekistan.

3.1.5 Bacteriological confirmation

Bacteriological confirmation of TB diagnosis was reported for 120 613 (67.0%) of all 180 113 new and relapse pulmonary cases in the Region (Table 7). Testing of cases using WRD (such as Xpert MTB/RIF) was much lower in the EU/EEA countries (28.3%) than in the non-EU/EEA countries and areas (81.7%). Nevertheless, the five-year trend shows a continuing increase in usage of WRDs across the Region, from 45.3% in 2015 to 69.3% in 2019 (Table XV; Fig. 3.1.2). Testing also varied considerably among countries, from 1.3% in Bulgaria to 100% in the Republic of Moldova. Bacteriological confirmation of new and relapse pulmonary cases was below 60% in six countries, underlining the need to strengthen diagnostics: Turkmenistan (48.0%), the Russian Federation (53.6%), Hungary (56.9%), Iceland (57.1%), Armenia (59.5%) and Uzbekistan (59.9%). In 31 countries, bacteriological confirmation of new and relapse pulmonary cases was 75% and above.

3.1.6 Age and sex

There is wide variation in the distribution of age- and sex-specific notification rates across countries and areas (Table 9). Notification rates in eastern European countries and areas are highest in young adults (25–44 years) and subsequently decrease with increasing age, while in the countries of central Asia and in Turkey, the notification rates either increase with age or are relatively constant across adult age groups.

In the 18 HPCs, the rate of TB in children under 5 years was lower than the notification rate among children aged 5–14 years, indicating that detection of TB remains particularly challenging in young children.

In countries and areas with at least 100 new and relapse TB cases, the proportion of TB cases notified in children (0–14 years) varied from below 1% (Bosnia and Herzegovina, Belarus, Croatia, Czechia and Estonia) to 16.7% (Slovakia) of all new and relapse cases. The difference in proportions of childhood TB cases across the countries and areas may reflect differences in case-finding practice (such as

contact-tracing), population age structure and under/overdiagnosis or reporting of childhood TB. The average percentage of new and relapse TB patients under 15 years in the Region is around 4%.

There were twice as many males as females reported among all incident TB cases, but large variation was observed for male predominance in the sex distribution of TB cases, ranging from almost even distribution to over three times greater in Armenia. The exception was Italy, where the number of female TB patients outnumbered those of males. In most countries and areas, gender differences in notification rates appear to be more significant among middle-aged and older adults. TB rates in males and females appear to be more similar in children and younger adults (0–14 and 15–24 years). The gender difference in TB case notification most probably reflects the overrepresentation of males in the various TB risk groups, notably homeless people, prisoners, seasonal migrant workers, people living with HIV, men who have sex with men and people who inject drugs.

3.1.7 Drug resistance

Fifty countries/areas in the Region reported on first-line anti-TB DST results in 2019.

Overall, DST coverage in the Region, at least for rifampicin among bacteriologically confirmed pulmonary TB cases, was 90.8%, with 39 countries/areas achieving coverage of 85% or higher. Only in three was the coverage less than 50%: Spain (26.8%), Albania (12.9%) and France (4.4%). The percentage of confirmed RR-TB cases among 86 176 new pulmonary TB cases tested for rifampicin resistance in the Region was 21.1% (Map 2, Fig. 3.1.3, Table 12 and Table V). While 11 countries/areas reported no RR-TB or less than 1% among new TB cases, the rate was over 20% in eight (Table 12). Overall for EU/EEA countries, the prevalence of MDR-TB cases among all confirmed new pulmonary TB cases tested for rifampicin resistance was 2.2%, but among previously treated pulmonary cases, the MDR-TB proportion was higher at 11.9% (Fig. 3.1.4).

Six HPC countries had an RR/MDR-TB prevalence ranging from 10% to 19% among new cases tested for rifampicin resistance: Estonia (16.8%), Armenia (16.3%), Lithuania

Fig. 3.1.2. New and relapse TB cases tested using WRD such as Xpert MTB/RIF, European Region, 2015–2019

Source: WHO (2).

(13.8%), Georgia (12.1%), Azerbaijan (11.5%) and Uzbekistan (11.7%). Four had 20–29% MDR-TB among new cases – Kyrgyzstan (29.5%), Tajikistan (29.0%), Ukraine (27.2%) and Kazakhstan (27.0%) – and three had an RR-TB prevalence over 30% – Belarus (37.7%), the Russian Federation (35.3%) and the Republic of Moldova (32.9%). The percentage of RR/MDR-TB is misleading for France, as DST results are only reported for RR-TB cases.

The percentage of confirmed RR/MDR-TB cases among 46 739 previously treated pulmonary bacteriologically confirmed TB cases whose isolates were tested for first-line DST was 54.5% (Fig. 3.1.3, Table 12 and Table VI).

Fifteen countries/areas had between 15% and 49% RR/MDR-TB among previously treated TB cases tested for first-line DST. The rate was even higher in some HPCs: the Russian Federation (70.8%), Belarus (59.8%), Kyrgyzstan (60.1%) and Estonia (50%) (Fig. 3.1.5, Table 12).

The rate of MDR-TB notification at regional level was 1.6 per 100 000 in 2019. This represents an average annual decrease of 3.9% between 2015 and 2019 (Table V).

Trends in the MDR percentage among new bacteriologically confirmed pulmonary TB cases and trends in the notification rate have differed by country/area in recent years (Table V). At subregional level, the proportion of MDR among new pulmonary TB cases remained stable in the EU/EEA subregion over the last five years, ranging between 2.1% and 2.3%. Similarly, the rate of notified MDR-TB cases remained stable at around 0.1 case per 100 000 population. The MDR percentage among new bacteriologically confirmed pulmonary TB cases in non-EU/EEA countries and areas also remained stable, ranging between 22.9% and 23.8%, but the rate per 100 000 population declined slightly from 3.9 to 3.6 per 100 000 population during the same period.

Forty-seven countries/areas reported second-line DST data among pulmonary TB patients in 2019. Data on second-line DST were available for about 94.5% of all notified pulmonary MDR-TB cases. Of the 32 320 pulmonary MDR-TB cases subjected to second-line DST, 7259 (22.5%) were XDR-TB (Table 14).

XDR-TB cases are rising in absolute terms; 956 cases were notified among pulmonary MDR-TB cases in 2015 and 7259 in 2019, largely due to the increase in the number of countries and areas reporting second-line DST data (Table VIII).

In EU/EEA countries, where 69.6% of MDR-TB cases were tested for second-line drugs, the prevalence of XDR among MDR cases was 22.4%.

Among the countries and areas reporting at least 30 MDR cases with second-line DST results, eight reported over 20% XDR prevalence among MDR-TB cases: Armenia (54.5%), Uzbekistan (34.8%), Lithuania (36.3%), Romania (30.9%), Tajikistan (26.1%), Azerbaijan (24.3%) and the Russian Federation (23.5%).

There is no clear trend in relation to XDR-TB prevalence in countries and areas with a long history of second-line DST surveillance among pulmonary MDR-TB cases (with data

reported every year from 2015 to 2019). In most countries and areas, the XDR percentage varies widely from year to year, but in Armenia, Georgia, the Republic of Moldova, the Russian Federation and Turkey, XDR prevalence among MDR-TB cases has increased over the past five years (Table VIII).

Of the 47 614 RR/MDR-TB patients notified in 2019, 45 472 (95.5%) were enrolled into MDR-TB treatment programmes and another 9457 patients into XDR treatment. Four HPCs reported a gap of over 5% between the number of patients diagnosed and enrolled to treatment (treatment coverage): Tajikistan (67.0%), Georgia (84.6%), the Republic of Moldova (85.3%) and Kyrgyzstan (86.3%) (Table 16).

In 2019, access to XDR-TB treatment at regional level exceeded 100%, influenced by data reported by the Russian Federation, Ukraine and Kazakhstan, but six HPCs – Azerbaijan, Belarus, Georgia, Kyrgyzstan, the Republic of Moldova and Tajikistan – reported a gap of over 5% in XDR-TB treatment coverage.

3.1.8 TB/HIV coinfection

Thirty-nine countries and areas provided surveillance data on TB/HIV coinfection (Table 17). Of the 184 944 new and relapse TB patients notified in the reporting countries/areas, 172 941 were screened for HIV (93.5%). Twelve HPCs achieved a testing level above 90%: Armenia, Azerbaijan, Belarus, Estonia, Georgia, Kazakhstan, Kyrgyzstan, the Republic of Moldova, the Russian Federation, Tajikistan, Ukraine and Uzbekistan. A total of 25 060 TB cases were detected with HIV-positive status, representing 14.5% of those tested (versus 13.0% recorded in 2018).

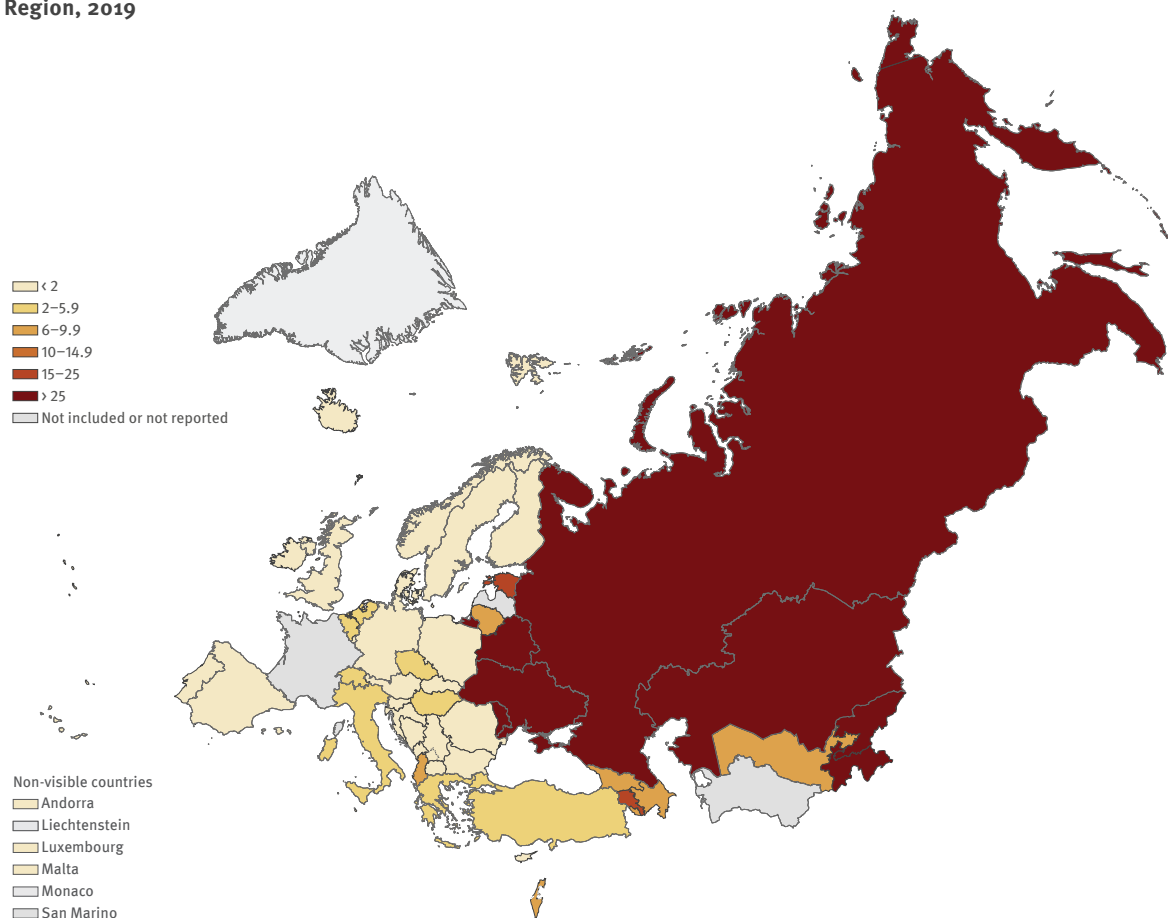

Among those countries and areas reporting representative HIV testing (above 50% HIV testing coverage), six documented a significant overlap of the HIV and TB epidemics by exceeding 10% HIV prevalence among new and relapse TB cases (Table 17): the Russian Federation (23.3%), Ukraine (23.0%), Estonia (11.6%), the Republic of Moldova (10.6%), Armenia (10.5%) and Portugal (10.5%). Three countries with representative routine surveillance had 5–10% HIV prevalence among TB patients: Belgium (7.8%), Belarus (7.1%) and Kazakhstan (5.4%).

Twenty-six countries and areas in the Region provided information on ART enrolment among TB cases with HIV-positive status in 2019. Of 24 836 HIV-positive TB cases, 18 836 (75.8%) had received ART. This is slightly higher than in 2018 (73.1%), but far below the WHO target of universal ART coverage. However, six of the HPCs did achieve ART coverage of over 90%: Armenia, Azerbaijan, Belarus, Bulgaria, Georgia and Kazakhstan.

3.1.9 Country of origin

TB patients of foreign origin represent 8.7% of all TB cases notified Region-wide: 34.5% in EU/EEA countries, and only 2.2% in non-EU/EEA countries and areas (Table 10). TB patients of foreign origin represent a large majority in several countries: Malta (95.9%), Luxembourg (90.0%), Cyprus (89.9%), Norway (88.5%), Israel (86.6%), Iceland

Map 2. Percentage of notified TB cases with MDR-TB among new pulmonary laboratory-confirmed TB cases, European Region, 2019

(84.6%), the Netherlands (74.7%), the United Kingdom (70.4%) and Switzerland (68.2%).

3.1.10 TB in prisons

Thirty countries/areas in the Region provided information on TB case-detection and treatment in prisons during 2019 (Table 19). Overall, 8754 (4.7%) of the new and relapse TB cases in the Region were reported from prisons, 8492 (96.9%) of which were in the HPCs. The proportion of TB cases in prisons represented about 1.7% of the country total in EU/EEA countries; in non-EU/EEA countries and areas, the proportion was 5.1%. The notification rate in prisons in non-EU/EEA countries and areas was 801 new TB cases per 100 000 prison population, which is about four times higher than in the EU/EEA subregion (185 per 100 000). The overall notification rate for new TB cases in prisons in the WHO European Region was 698 per 100 000 prison population. The TB notification rate exceeded 1000 cases per 100 000 detainees in five countries: Azerbaijan, Kyrgyzstan, the Republic of Moldova, the Russian Federation and Ukraine. The highest TB-related risks in prison (relative to incidence in the general population) are calculated to be in the Russian Federation (RR 24.2), followed by Ukraine (RR 23.8), Kyrgyzstan (RR 23.6), Azerbaijan (RR 23.2) and Belgium (RR 23.2).

3.1.11 Treatment outcome

The treatment success rate among 173 058 new and relapse TB cases having started treatment with first-line drugs in 2018 was 76.5% (Table 21). In the HPCs, the average rate of cases cured or for whom treatment was completed was 77.4%. The treatment success rate was slightly lower in the EU/EEA countries than in non-EU/EEA countries and areas (73.1% versus 77.4%), both showing results comparable with the previous year. Only 14 countries and areas achieved an 85% treatment success rate in this treatment cohort. Another 13 were close to the target, with success rates of 80–85%. Seven had treatment success rates below 60%, with a very high proportion of cases not evaluated.

A total of 13 930 (8.0%) cases were reported to have died in the same cohort, 4.5% to have been lost to follow up and 3.9% to have had treatment that failed. These unfavourable outcomes were lower in the EU/EEA countries than in the rest of the Region, exemplified by the proportion of patients with failed treatment – 0.6% in the EU/EEA versus 4.7% in non-EU/EEA countries and areas (Table 21). Countries reporting fatal outcomes in excess of 10% were Hungary (15.6%), Slovenia (14.3%), Estonia (13.9%), Czechia (13.5%), Croatia (11.0%) and the Russian Federation (10.6%).

Fig. 3.1.3. Percentages of MDR among laboratory-confirmed pulmonary TB cases, European Region, 2015–2019

Fig. 3.1.4. Percentages of MDR-TB among laboratory-confirmed pulmonary TB cases, EU/EEA, 2015–2019

Fig. 3.1.5. Percentages of MDR-TB among laboratory-confirmed pulmonary TB cases, 18 HPCs, 2015–2019

The Russian Federation accounted for almost half of the deaths in the Region in absolute numbers.

The treatment success rate among the 5706 child TB cases (aged 0–14 years) in the 2018 cohort was 89.4% (Table 22). The treatment success rate in EU/EEA countries was remarkably lower than in the non-EU/EEA countries

and areas (79.9% versus 93.1%). Among child TB cases in the Region, 0.9% died, another 1.0% failed and 1.3% were lost to follow up.

Of the 17 928 TB/HIV coinfecting patients who started treatment throughout the Region in 2018, only 9247 (51.6%) had a successful treatment outcome (Table 24).

In the 2017 cohort, treatment outcome was notified for 43 720 laboratory-confirmed RR/MDR-TB cases reported by 44 countries/areas (Table 26). The treatment success rate for the whole Region was 58.6%, which is slightly higher than the 57.4% rate reported for the 2016 RR/MDR-TB treatment cohort. The treatment success rate for RR/MDR-TB patients was higher in non-EU/EEA countries and areas than in the EU/EEA (58.9% versus 45.7%). The countries that performed best were Norway (88.9%), Switzerland (83.3%), Sweden (81.8%), Kazakhstan (81.3%) and Belgium (80.0%). In the Region as a whole, 13.8% of RR/MDR-TB cases died, 11.3% failed and 10.7% were lost to follow up.

3.1.12 Conclusion for the WHO European Region

As in past years, the fastest annual decline in TB incidence in the world was observed in the WHO European Region: 5.1% between 2015 and 2019. The cumulative reductions for the period 2015–2019 were 19.0%, indicating that the Region has almost reached the 2020 End TB Strategy milestone to reduce the TB incidence rate in 2020 by 20% against the 2015 baseline, and is on track to achieve the regional action plan target of a 25% reduction in the TB incidence rate. However, the impact of the COVID-19 pandemic on TB service delivery and surveillance (which will be seen in the next report) may affect the achievement of the targets in future years. Disruptions in TB service delivery and a decrease in TB case notifications have already been documented and reported from a few high TB burden countries worldwide (1).

There were an estimated 20 000 TB deaths among HIV-negative people in 2019, with considerable variation across the Region, and 86% of TB deaths were attributed to the 18 HPCs. Twelve per cent of incident TB cases were estimated to be coinfecting with HIV, marking the third year of halted growth after the unprecedented increase from 3% to 12% during 2007–2016. Two countries, the Russian Federation and Ukraine, account for almost 83% of the estimated TB/HIV coinfecting patients in the Region.

Eighty-eight per cent of the estimated new and relapse cases were notified in the Region in 2019, which is substantially higher than the global TB detection of 71%.

The Region is faced with the challenge of having a high burden of RR/MDR-TB. Nine of the 30 countries with the highest RR/MDR-TB burden in the world are in the WHO European Region (Azerbaijan, Belarus, Kazakhstan, Kyrgyzstan, the Republic of Moldova, the Russian Federation, Tajikistan, Ukraine and Uzbekistan). Around 70 000 people in the Region are estimated to develop RR/MDR-TB each year, and it is of the utmost importance that capacity exists at country/area level to rapidly detect resistant TB. Over the past five years, there has been rapid uptake of WRD, with 69.3% of incident TB cases tested using this platform in 2019, compared to 45.3% in 2015.

Overall, most countries and areas achieved coverage of 85% or higher for first-line DST among bacteriologically confirmed pulmonary TB cases, but they should aim to have universal coverage. Ninety-four per cent of all notified

RR/MDR-TB cases in the Region had second-line DST available, with most countries and areas reporting coverage close to 100%.

TB is a major cause of death among people living with HIV, so rapid detection and appropriate treatment are vital. In 2019, 84% of an estimated 30 000 HIV patients coinfecting with TB were detected, and 76% of them were offered ART. Only 71% of coinfecting patients notified in 2018 had TB treatment outcomes available in 2019. This underlines the need to strengthen collaboration between TB and HIV programmes and to improve surveillance of coinfection in the Region.

Most countries and areas offer universal access to TB and MDR-TB treatment. Ninety-five per cent of the RR/MDR-TB cases notified in 2019 were enrolled into drug-resistant treatment programmes. The regional average is heavily influenced by the Russian Federation, as it includes more than half of all MDR-TB and XDR-TB patients detected in the Region.

The treatment outcome for both incident TB and RR/MDR-TB cohorts were 76.5% and 58.4% respectively, which is comparable with the results for the previous year.

3.2 EU/EEA countries

3.2.1 Data completeness

TB notification data for 2019 were reported by 29 of 31 countries (there were no case-based data from Latvia or Liechtenstein for 2019). The reporting of non-mandatory variables in 2019 was complete or near complete (> 95.0%) for age, gender, TB site and variables defining the origin of a case (Annex 3). Overall, previous treatment history was available for 86.6% of cases reported in 2019, but completeness ranged from below 70.0% in five countries (Croatia 5.3%, France 56.9%, Ireland 65.0%, Luxembourg 62.0% and Spain 62.6%) to 100.0% in 12 (Annex 3).

Among TB cases reported in 2019, 81.1% had culture results reported (Annex 3), which was a similar proportion to that reported in 2018 (82.5%). Only five countries had less than 75% of cases with culture results reported: France (46.4%), Greece (62.7%), Malta (51.0%), Portugal (62.9%) and the United Kingdom (61.9%). Reporting completeness for microscopy was slightly lower in 2019 (83.0%) compared to 2018 data (84.1%) and ranged from 41.7% in Belgium to 100% in Lithuania. For 2019, drug-susceptibility reporting completeness was 74.4% for the first-line drugs (isoniazid and rifampicin). Second-line DST reporting completeness was 100% for the 25 countries that reported at least one MDR-TB case (Annex 3); three countries (Iceland, Malta and Slovenia) reported no MDR-TB cases in 2019 (Table 13).

The number of countries reporting HIV status continued to decrease, with only 19 (of 29) reporting HIV status in 2019 compared to 21 (of 30) in 2018 and 23 (of 31) in 2017. HIV status was available only for 32.3% of all TB cases reported in 2019, but nine countries reported HIV status for more than 75% of their TB cases.

Treatment outcome at 12 months was available for 65.0% of all cases reported in 2018. Among MDR-TB cases reported in 2017, 96.1% had treatment outcome at 24 months completed. Treatment outcome at 36 months for XDR-TB cases reported in 2016 was complete for 95.8% of cases. In 2019, the completeness of treatment outcomes across all three cohorts had decreased compared to 2018.

3.2.2 Time and place

In 2019, 49 752 cases of TB were reported in 29 EU/EEA countries (Table 3). Four countries reported more than 5000 cases each (France, Poland, Romania and the United Kingdom), accounting for 54.7% of all reported cases, with Romania alone accounting for 23.4% of all TB cases reported in 2019.

The EU/EEA notification rate in 2019 was 9.6 per 100 000 population (Table 1), continuing the downward trend observed since the launch of European enhanced TB surveillance in 1996 (Fig. 3.2.1). During the period 2015–2019, the average annual decline in the notification rate was 5.1% (Table 3).

As reported for previous years, country-specific notification rates differed considerably in 2019, ranging from 3.1 per 100 000 population in Norway to 59.9 per 100 000 in Romania (Table 3). Rates were below 10 per 100 000 in 22 countries and below 20 per 100 000 in 27. Only two countries (Lithuania and Romania) had notification rates above 30 per 100 000 population (37.9 and 59.9 per 100 000, respectively).

In 24 countries, the notification rates have fallen compared with 2015 (Table 3). The downward trend was particularly pronounced in Croatia, Hungary, Norway and Sweden, where the average annual rate of decrease exceeded 10%.

3.2.2 Previous treatment, laboratory confirmation and TB site

The distribution of cases by previous treatment history was similar in 2019 to that reported in previous years: 38 267 (76.9%) of 49 752 TB cases reported in 2019 were newly diagnosed, 4843 (9.7%) had previously been treated for TB and 6642 (13.4%) had an unknown previous treatment status (Table 5). The proportion of previously treated cases was more than 10% in seven countries: Bulgaria, Estonia, Hungary, Lithuania, Poland, Romania and Slovenia.

Laboratory confirmation was reported for 33 368 (67.1%) of the 49 752 TB cases reported in 2019 (Table 8). Country-specific proportions of laboratory-confirmed cases ranged from 35.3% in France to 92.1% in Slovenia. The proportion of laboratory-confirmed TB cases remained stable in 2019 compared to 2018 (68.2%) and 2017 (68.1%). Among the five HPCs (of which four reported 2019 data), Estonia and Lithuania had the highest proportions of confirmed cases (85.3% and 88.4%, respectively), followed by Romania (73.1%) and Bulgaria (46.6%).

Of all 49 752 TB cases reported in 2019, 34 975 (70.3%) were diagnosed with pulmonary TB, 10 988 (22.1%) with extrapulmonary TB, 3514 (7.1%) with a combination of both and 275 (0.6%) had no TB site reported (Table 6). The proportion of extrapulmonary TB was above 30% in six countries: France (31.0%), Iceland (46.2%), the Netherlands (41.9%), Norway (33.9%), Sweden (37.2%) and the United Kingdom (42.9%).

Of 36 819 new and relapse pulmonary TB cases reported in 2019, 29 929 (81.3%) were confirmed by culture and/or smear and nucleic acid amplification test (Table 7). In six countries, over 30% of reported new and relapse pulmonary TB cases were diagnosed clinically: Bulgaria (38.2%), France (31.6%), Hungary (43.1%), Iceland (42.9%), Malta (40.8%) and Slovakia (30.2%).

Fig. 3.2.1. TB notification rate per 100 000 population by year of reporting, EU/EEA, 1995–2019

Source: ECDC (3).

According to the EU case definition, 33 368 (67.1%) of 49 752 TB cases reported in 2019 would be classified as confirmed, 5022 (10.1%) as probable and 11 362 (22.8%) as possible cases (Table 8). In 14 countries, over 75% of reported cases were confirmed, with the highest proportion of confirmed cases reported by Lithuania (88.4%) and Slovenia (92.1%). Conversely, four countries reported over 40% of their TB cases as possible cases (that is, only clinically diagnosed): Bulgaria (44.3%), France (44.3%), Hungary (43.8%) and Malta (42.9%). The high proportion of clinically diagnosed cases may reflect underreporting of laboratory results to the national surveillance systems in these countries, or alternatively could indicate that TB may be overdiagnosed in these countries.

3.2.3 Age and sex

Of 47 504 new and relapse TB cases reported in 2019, 30 998 (65.3%) were aged between 25 and 64 years and 9052 cases (19.1%) were in adults aged over 64 years (Table 9). Notification rates were similar among the 15–24, 25–44 and 45–64 years age groups (11.6, 11.9 and 10.5 per 100 000 population, respectively).

There was variation in the age distribution of cases between countries: in most, the cases predominantly were aged between 25 and 64 years, but cases were younger in Malta (52.0% were aged between 15 and 24 years) and older in Croatia, Estonia, Poland and Slovenia (more than 70% of cases were aged over 45 years (Table 9)).

Children under 15 years accounted for 1928 (4.1%) of 47 504 new and relapse TB cases reported in 2019 and children aged between 5 and 14 years had the lowest notification rate of all age groups (2.1 per 100 000 population (Table 9)). Romania reported the highest notification rates among children under 15 years: 14.1 cases per 100 000 children aged between 0 and 4 years, and 12.2 cases per 100 000 aged between 5 and 14 years (Table 9).

In 2019, the male-to-female ratio in new and relapse TB cases was 1.8 (Table 9), which was lower than the ratio reported in 2018 (male-to-female ratio: 2.0). All EU/EEA Member States reported more male than female new and relapse TB cases, except for Italy. For children under 15 years, the male-to-female ratio among new and relapse cases was 1.1.

3.2.4 Origin of cases

Of the 49 752 TB cases notified in 2019, 31 239 (62.8%) were born in, or were citizens of, the reporting country (referred to as “native”), 17 181 (34.5%) were of foreign origin and 1332 (2.7%) were of unknown origin (Table 10). Of the 17 181 cases of foreign origin in 2019, 10 076 (58.6%) were reported by France, Germany and the United Kingdom. Country-specific proportions of foreign-origin TB cases ranged from 0.0% in Bulgaria and 0.4% in Romania to above 85% in Cyprus, Luxembourg, Malta, Norway and Sweden. Countries with TB notification rates higher than 10 per 100 000 population, with the exception of Malta, reported less than 25% of cases as being of foreign origin. The overall proportion of native TB cases has declined from 66.7% in 2015 to 62.8% in 2019 (Table IV).

3.2.5 Drug resistance

Annex 5 displays participation and performance in an EQA scheme for DST by Member State.

Of 31 007 laboratory-confirmed TB cases notified in 2019, 24 812 (80.0%) had isoniazid and rifampicin susceptibility testing results reported (Table 13). Resistance to any anti-TB drug was reported for 2638 (10.6%) cases. Overall, of 24 812 cases with the relevant DST results, MDR-TB was reported for 834 cases (3.4%). Among the cases with relevant DST results, the proportion that were MDR-TB varied by country: France reported 100.0% of cases with DST results as MDR-TB (DST results are reported only for MDR-TB cases), while Estonia and Lithuania reported that among cases with DST results, 38.6% and 32.0%, respectively, were MDR-TB. The total number of reported MDR-TB cases has continued to decrease each year, but the rate of MDR-TB cases remained at 0.2 per 100 000 population in 2019 (Table VII).

In 2019, XDR-TB was reported for 128 (21.9%) of 584 MDR-TB cases with results for second-line DST (Table 15). The proportion of XDR-TB cases among pulmonary MDR-TB cases with results for second-line DST has remained between 20% and 25% since 2015 (Table VIII). Lithuania and Romania reported 75.0% of the XDR-TB cases in 2019, which is an increased proportion compared with the previous four years (during which they reported between 60% and 70% of XDR cases (Table VIII)).

Of 19 333 new confirmed pulmonary TB cases with rifampicin DST results, 504 (2.6%) were resistant to rifampicin (Table 12). In contrast, 384 (13.3%) of 2887 previously treated confirmed pulmonary TB cases with rifampicin DST results were resistant to rifampicin. Previously treated pulmonary TB cases were five times as likely to be resistant to rifampicin compared with new pulmonary cases.

3.2.6 TB/HIV coinfection

HIV status was reported for 16 088 (78.0%) of 20 620 TB cases reported from the 19 countries that reported HIV status of TB cases (Table 18). Of the 16 088 cases with known HIV status, 502 (3.1%) were reported as HIV positive. Among countries with at least 50% reporting completeness for HIV status, the proportion of coinfecting cases was highest in Estonia (11.3%) and Portugal (11.0%). The proportion of HIV-coinfecting TB cases has declined from 4.6% in 2015 to 3.1% in 2019 (Table IX).

3.2.7 TB in prisons

For 2019, 13 EU/EEA countries reported 386 new and relapse TB cases in prisons, resulting in a notification rate of 185 per 100 000 prison population and an RR of 15.8 compared to the general population in the same countries (Table 19). Overall, TB cases in prisons accounted for 1.7% of all new and relapse cases notified in the 13 reporting EU/EEA countries, with the proportion being highest in Poland (3.2%), Portugal (2.3%) and Slovakia (2.8%).

3.2.8 Treatment outcome

Of all 42 811 TB cases notified in 2018 with a treatment outcome reported in 2019, 27 277 (63.7%) were treated successfully, 2853 (6.7%) died, 358 (0.8%) experienced treatment failure, 1623 (3.8%) were lost to follow up, 1705 (4.0%) were still on treatment in 2019 and 8995 cases (21.0%) were not evaluated (Table 20). Among the 24 countries that reported treatment outcome for the 2018 cohort, six countries reported successful treatment for over 80.0% of cases (Belgium 80.9%, Bulgaria 84.5%, Iceland 100.0%, the Netherlands 85.1%, Norway 82.7% and Slovakia 90.7%), while five countries reported death as the outcome for over 10.0% of cases (Croatia 11.0%, Czechia 13.5%, Estonia 14.3%, Hungary 15.2% and Slovenia 15.2% (Table 20)).

Among the 35 316 TB cases notified in 2018 and classified as new and relapse TB cases, including those with unknown previous treatment history and excluding those that were started on second-line treatment, 25 809 (73.1%) were treated successfully (Table 21). In countries where at least 75% of these new and relapse TB cases had a known outcome, treatment success ranged from 65.7% in Hungary to 100.0% in Iceland. The overall proportion of successfully treated cases among these new and relapse TB cases decreased from 76.5% of cases notified in 2014 to 73.1% of cases notified in 2018 (Table X).

Of 952 MDR-TB cases notified in 2017 with a treatment outcome reported in 2019, 446 (46.8%) were treated successfully, 149 (15.7%) died, 104 (10.9%) experienced treatment failure, 113 (11.9%) were lost to follow up, 85 (8.9%) were still on treatment in 2019 and 113 (11.9%) were not evaluated (Table 27). The proportion of MDR-TB cases with successful treatment was highest in Norway (88.9%), Sweden (81.8%) and Belgium (80.0%) (Table 27). Overall, the 24-month treatment success rate for RR/MDR-TB remained low for cases reported in 2017 (45.4%) and was lower than for cases reported in 2016 (49.9%) (Table XII).

Ten countries reported 172 XDR-TB cases in 2016 and a treatment outcome for these cases in 2019: 60 (34.9%) were treated successfully, 45 (26.2%) died, 31 (18.0%) experienced treatment failure, 18 (10.5%) were lost to follow up and 18 (10.5%) were not evaluated (Table 29). The 36-month XDR-TB treatment success rate remained low among the 2016 XDR-TB cases, but variations over time should be interpreted with caution due to the small number of cases (Table XIV).

Of 501 HIV-positive TB cases notified in 2018 (who were not started on second-line treatment and had a treatment outcome reported in 2019), 275 (54.9%) were reported as successfully treated, 62 (12.4%) died, four (0.8%) experienced treatment failure, 51 (10.2%) were lost to follow up, 66 (13.2%) were still on treatment in 2019 and 44 (8.6%) were not evaluated (Table 24).

3.2.9 WHO disease burden estimates

According to WHO, the estimated TB incidence in the EU/EEA overall (excluding Liechtenstein) was 10.6 per 100 000 population in 2019 (Table 1 and Table II). Of the

30 countries with estimates, 22 had an estimated incidence of less than 10.0 per 100 000 population (Table 1 and Table II). The overall number of estimated TB deaths, excluding HIV deaths in people who were HIV positive, was 3560 for the EU/EEA in 2019, a slight decrease compared to the 3730 estimated for 2018 and almost a 40% reduction on the 5800 estimated for 2010 (Table I).

3.2.10 Conclusions for the European Union/ European Economic Area

In 2019, 29 of 31 EU/EEA countries reported TB notification data and a total of 49 752 TB cases. There was a further decline in the overall TB notification rate to 9.6 per 100 000 population, which continued the decreasing trend observed since 2002. As in previous years, a few countries reported a large proportion of the total number of cases, including Romania, which reported almost a quarter of all TB cases in 2019.

While the decreasing notification rates observed in most countries are reassuring, there is still significant work ahead to reach the United Nations Sustainable Development Goal 3 target of an 80% reduction in the TB incidence rate in 2030 compared to 2015. The target at EU/EEA level is a notification rate of 2.4 per 100 000 population (based on an 80% reduction of the 2015 TB notification rate of 11.9 per 100 000 population). Although progress is being made towards this goal, at the current rate of decline most EU/EEA countries are not on track to reach the 80% reduction target by 2030, or the elimination target by 2050 (4). Countries need to accelerate progress towards these goals to achieve them.

The overall proportion of native TB cases has continued to decline in the EU/EEA since 2015, with approximately one third of all TB cases in 2019 being of foreign origin. However, the proportion of foreign- versus native-origin cases varies significantly between countries, highlighting that different approaches to TB screening and disease prevention are needed. In countries with a higher proportion of foreign-origin cases, screening for active TB or TB infection among newly arrived migrants from high-incidence countries remains an important measure for TB disease prevention (5).

Data on HIV coinfection remained incomplete in the EU/EEA, and the number of countries reporting HIV status was lower in 2019 than in 2018. HIV status was reported only for approximately one third of all reported TB cases across the EU/EEA in 2019, limiting the conclusions that can be drawn about this important cohort. This is especially true with regard to treatment outcomes among TB/HIV coinfecting cases, which accounted for 4.1% of TB cases in the EU/EEA with known HIV status in 2018.

Data on TB in prisons are scarce and the number of countries reporting also declined in 2019. With only 13 EU/EEA countries reporting in 2019, the conclusions that can be drawn about TB in prisons are also very limited. Although the proportion of TB cases among inmates in the countries that reported was low, the data indicate nevertheless that inmates have a 16-times higher risk of being reported as

a TB case than the general population. Public health guidance concluded in 2018 that it is advisable to offer universal testing for active TB at prison entry so that treatment can be initiated and transmission prevented (6). Further to this, additional efforts must be made to collect TB data within prison settings to better understand the risks within this setting.

Reassuringly, the number of MDR-TB and XDR-TB cases in the EU/EEA continued to decrease in 2019, despite the high number of drug-resistant TB cases in the European Region HPCs bordering the EU/EEA. DST results for first-line drugs were reported only for approximately 75% of laboratory-confirmed TB cases in 2019, indicating that there is still considerable room for improvement here. Countries need DST results to be able to diagnose and treat drug-resistant TB, and to monitor this threat.

The WHO target for treatment success in new and relapse cases is 85% (7). Data reported in 2019 (73.1% treatment success rate) indicate that improvement is needed to reach the treatment success target. The target for successful treatment among MDR-TB cases after 24 months is 75%, and overall the EU/EEA is far below where it should be (at 46.8% of MDR-TB cases with treatment success). In 2020, WHO released updated treatment guidelines for drug-resistant TB that recommend an all-oral bedaquiline-based shorter regimen (instead of the previously recommended injectable-based shorter regimen), all-oral regimens (whether shorter or longer) for all MDR-TB cases and the so-called BPaL regimen (a new agent, pretomanid, with bedaquiline and linezolid, under operational research conditions only) for MDR-TB cases with additional resistance to fluoroquinolones (8). The move away from injectable agents to all-oral regimens, and new agents such as pretomanid, provide hope that the rate of treatment success for MDR-TB will improve in the future.

Finally, the slight deterioration in the completeness of 2019 data (particularly HIV status and treatment outcomes) may have been due to the widespread disruption in TB services caused by the COVID-19 pandemic from early 2020. Despite much of the 2019 data having been collected during 2019, countries were required to collate, submit, check and clean the data during 2020, while also managing COVID-19 pandemic-related work. Countries ensured they submitted TB data, highlighting their commitment to, and the importance of, maintaining TB essential services and monitoring. The broader impact of the COVID-19 pandemic will be reflected in the 2020 TB surveillance data, as during 2020 there were anecdotes of disruptions to (or reallocation of) TB laboratory (9) and clinical services, as well as major pressures to public health workforce capacity and limitations on patient access to TB services (1).

In late 2018, EU/EEA countries reaffirmed their commitment to ending the TB epidemic at a United Nations high-level meeting (10). The 2019 data presented in this report indicate that there is still considerable work ahead to achieve this goal, and with the ongoing disruption caused by the COVID-19 pandemic, now is the time to prioritize and intensify public health measures against TB. As always, ECDC remains committed to supporting EU/EEA countries to end the TB epidemic.

4. Commentary – monitoring

4. Commentary – monitoring

To address the challenges to TB and MDR/XDR-TB prevention and care, the WHO Regional Office for Europe, working in close consultation with representatives from countries and areas, experts and communities, developed the *Tuberculosis action plan for the WHO European Region 2016–2020* (1). This action plan is based on lessons learned from implementing the seven areas of intervention in the *Consolidated action plan to prevent and combat multidrug and extensively drug-resistant tuberculosis in the WHO European Region 2011–2015* (2) and is in line with the global End TB Strategy and other health policy guidance, such as the European policy for health and well-being, *Health 2020* (3). The *Tuberculosis action plan for the WHO European Region 2016–2020* is supported by a monitoring and evaluation framework to monitor progress towards defined targets. The framework consists of 26 indicators that enable performance monitoring in the action plan's areas of intervention and follow on from the Berlin Declaration on Tuberculosis of 2007 (4). Nine are core indicators for monitoring and reporting to the WHO Regional Committee for Europe. In addition, the selection of indicators was harmonized with the End TB Strategy's recommended top-10 global indicators. The status of the core indicators, which is analysed on an annual basis, is included in the surveillance report every second year.

The final year covered by the action plan was 2020, so the WHO Regional Office for Europe has developed a final report that provides an overview of implementation. This is based on a summary report that was reviewed and approved by the Standing Committee of the Regional Committee and subsequently submitted to the 70th session of the WHO Regional Committee for Europe in 2020, in line with resolution EUR/RC65/R6. The report summarizes the progress and challenges and the next steps in ending TB and drug-resistant TB in the WHO European Region (5). The next and the final update with the status of all indicators will be presented in the TB surveillance and monitoring in Europe 2022 report.

Cp: compulsory reporting.

Co: comprehensive.

C: case-based.

EU/EEA: European Union/European Economic Area.

TESSy: The European Surveillance System.

TME: WHO Tuberculosis Monitoring and Evaluation platform.

Y: yes.

^a For some years, data from France, Italy and Spain related to drug-susceptibility testing have been collected in aggregated format from the WHO TME.^b Data reported since 2012 to TESSy, historical data extracted from WHO TME.

Annex 2. List of variables for 2019 tuberculosis data collection^a

List	Description
Common set of variables	
1 RecordId	Unique identifier for each record generated by the national surveillance system
2 RecordType	Structure and format of the data
3 RecordTypeVersion	Indicates which version the sender uses when generating the data for upload
4 Subject	Disease to report
5 Status	Status of reporting NEW/UPDATE or DELETE (inactivate)
6 DataSource	The data source (surveillance system) from which the record originates
7 ReportingCountry	The country reporting the record
8 PlaceOfNotification	Place of the first notification of the case to a regional authority
9 PlaceOfResidence	Place of residence of patient at the time of disease onset
10 Age	Age of patient in years as reported in the national system
11 Gender	Gender of the reported case
12 DateOfDiagnosis	First date of clinical or laboratory diagnosis
13 DateOfNotification	Date when the case is first reported to public health authorities
14 DateUsedForStatistics	The reference date used for standard reports (usually one of the above)
Disease-specific variables	
15 BornReportingCountry	The patient was born in the country of report
16 CountryOfBirth	Country of birth of patient
17 CountryOfNationality	Country of nationality of patient
18 DateOfEntryToCountry	Date of entry to country – for TB cases not born in the reporting country
19 NationalityReportingCountry	Origin of the patient (based on citizenship)
20 MajorSiteOfTB	Major site of the disease
21 MinorSiteOfTB	Minor site of the disease
22 PrevDiagnosis	Previous diagnosis of TB in the past
23 PrevDiagnosisYear	Year of previous diagnosis
24 PrevTreatment	Previous anti-TB drug treatment (at least one month of drug combination)
25 PrevTreatmentCompletion	Completion of the previous anti-TB drug treatment
26 DiagnosedAnteMortem	Vital status of the patient at the time of diagnosis
27 EnrolledToTreatment	Patient started appropriate TB treatment according to international recommendations
28 Outcome12Months	Patient first outcome at 12 months from the start of the treatment
29 Outcome24Months	The first outcome observed 13–24 months from the start of treatment
30 Outcome36Months	The first outcome observed 25–36 months from the start of treatment
31 ResultCulture	The result of the culture test for <i>Mycobacterium tuberculosis</i> complex
32 ResultMicroscopy	The result of the microscopy test performed
33 ResultOtherTest	Additional laboratory test results
34 Pathogen	Species and gene (<i>M. tuberculosis</i> complex) of the pathogen that is the cause of the reported disease
35 HIVStatus	Result of the last HIV test
36 SIR_AMK	Susceptibility to amikacin
37 SIR_BDQ	Susceptibility to bedaquiline
38 SIR_CAP	Susceptibility to capreomycin
39 SIR_DLM	Susceptibility to delamanid
40 SIR_ETH	Susceptibility to ethambutol
41 SIR_GAT	Susceptibility to gatifloxacin
42 SIR_INH	Susceptibility to isoniazid
43 SIR_KAN	Susceptibility to kanamycin
44 SIR_LVX	Susceptibility to levofloxacin
45 SIR_MFX	Susceptibility to moxifloxacin
46 SIR_OFX	Susceptibility to ofloxacin
47 SIR_PZA	Susceptibility to pyrazinamide
48 SIR_RIF	Susceptibility to rifampicin
49 SIR_STR	Susceptibility to streptomycin
50 IsolateID	Unique identifier for each isolate within the data source/laboratory system related to the case
51 ECDCIsolateID	Identifier for each isolate record that is guaranteed to be unique across countries/areas/laboratories/pathogens and does not contain additional encoded information
52 SpoligoCode ^b	Spoligo pattern code
53 MiruCode ^b	MIRU pattern code
54 BeijingGenotype ^b	Beijing genotype identification

^a Notification of tuberculosis (TB) cases for 2019, treatment outcome data updated for cohort 2018 and multidrug-resistant TB treatment outcome data updated for cohort 2017 and extensively drug-resistant TB treatment outcome data updated for cohort 2016.

^b Optional variable. No need to be reported if the "IsolateID" or "ECDCIsolateID" is provided.

Note: WHO European Region tuberculosis high-priority countries presented in italics.

DST FLD: drug-susceptibility testing for first-line anti-tuberculosis drugs, calculated for confirmed tuberculosis cases.

DST SLD: drug-susceptibility testing for second-line anti-tuberculosis drugs, calculated only for multidrug-resistant tuberculosis cases.

EU/EEA: European Union/European Economic Area.

^a For determining the origin, two variables were merged: Born/Reporting Country and Nationality/Reporting Country, depending on country preference.

^b History of previous treatment defined by previous diagnosis of tuberculosis for cases reported by Belgium, Denmark, Ireland, Norway and the United Kingdom.

^c Data for the 2018 cohort.

^d Data for the multidrug-resistant tuberculosis 2017 cohort cases that are reported as "still on treatment" at 12 months.

^e Data for the extensively drug-resistant tuberculosis 2016 cohort cases that are reported as "still on treatment" at 12 months and 24 months.

Annex 4. Reporting completeness into Global TB Database, 2019

Country/area	Identification (%) (17 fields)	Notification (%) (58 fields)	Anti-tuberculosis (TB) drug resistance surveillance (%) (45 fields)	Treatment outcome of TB cases by risk categories (%) (79 fields)	Implementing End TB Strategy (%) (86 fields)	Budget and expenditure (%) (49 fields)

6. Tables

Summary table. Tuberculosis (TB) surveillance data by region, European Region, 2019

Data item	Table showing data by country/area	Region							
		EU/EEA		Non-EU/EEA		Total		18 high-priority countries ^a	
		Number of reporting countries/areas ^b	Value	Number of reporting countries/areas ^b	Value	Number of reporting countries/areas ^b	Value	Number of reporting countries/areas ^b	Value
Total population (millions)	-	30	518.1	23	411.9	52	930.2	18	409.4
Estimates of TB disease burden, 2019^c									
Estimated TB mortality rate (excluding HIV-related deaths) per 100 000 population	1	30	0.7	21	4.1	51	2.2	18	4.3
Estimated TB incidence rate per 100 000 population	1	30	10.6	23	46.6	53	26.4	18	49.8
Estimated RR-TB cases among notified bacteriologically confirmed pulmonary TB patients	2	31	1 170	22	44 100	53	46 000	17	44 800
Estimated percentage of HIV infection among incident TB cases (new and relapse)	2	29	3.8	20	14.7	49	12.0	18	14.0
Notifications of TB cases, 2019									
Total number of TB cases	3	29	49 752	22	210 194	51	259 946	17	221 270
All TB cases per 100 000 population	3	29	9.6	22	51.0	51	28.0	17	54.3
Mean annual percentage change of notification rate (2015–2019)	3	29	-5.1%	22	-5.3%	51	-5.1%	17	-5.2%
Number of new and relapse TB cases	4	29	47 504	22	168 367	51	215 871	17	178 890
New and relapse TB cases per 100 000 population	4	29	9.2	22	40.9	51	23.2	17	43.9
Mean annual percentage change of notification rate of new and relapse TB cases (2015–2019)	4	29	-5.0%	22	-5.9%	51	-5.5%	17	-5.8%
Percentage of new cases among all TB cases	5	29	76.9%	22	66.6%	51	68.6%	17	67.2%
Percentage of retreatment cases among all TB cases	5	29	9.7%	22	33.4%	51	28.8%	17	32.8%
Percentage of pulmonary TB among all TB cases	6	29	77.4%	-	-	-	-	-	-
Percentage of laboratory-confirmed TB cases among all TB cases	8	29	67.1%	-	-	-	-	-	-
Male-to-female ratio of new and relapse TB cases	9	29	1.8	22	1.9	51	1.9	17	2.0
Percentage of foreign TB cases among all TB cases	10	29	34.5%	19	2.2%	48	8.7%	14	1.8%
TB case laboratory confirmation, MDR and XDR, 2019									
Percentage of laboratory-confirmed cases among new pulmonary TB cases ^d	12	29	75.9%	21	62.2%	50	65.0%	16	63.4%
Percentage of DST results reported among new bacteriologically confirmed pulmonary TB cases	12	29	86.5%	21	93.2%	50	91.6%	16	93.4%
Percentage of MDR-TB among new pulmonary TB cases	12	29	2.2%	21	26.6%	50	21.1%	16	24.7%
Percentage of MDR-TB among previously treated pulmonary TB cases	12	29	11.9%	21	57.4%	50	54.4%	16	55.6%
Percentage of DST results reported among all confirmed TB cases	13	28	80.0%	-	-	-	-	-	-
Percentage of MDR-TB among all TB cases	13	28	3.4%	-	-	-	-	-	-
Percentage of XDR-TB among all MDR-TB cases with DST for SLD	14	29	22.4%	18	22.5%	47	22.5%	15	22.6%
TB/HIV coinfection, 2019									
Percentage of new and relapse TB cases with known HIV status	17	19	77.9%	20	95.4%	39	93.5%	16	95.3%
Percentage of HIV-positive cases among new and relapse TB cases with known HIV status	17	19	3.0%	20	15.6%	39	14.5%	16	14.7%
Percentage of HIV-positive new and relapse TB cases started on ART	17	7	85.7%	19	75.7%	26	75.8%	15	75.9%
Percentage of all TB cases with known HIV status	18	19	78.0%	-	-	-	-	-	-
Percentage of HIV-positive cases among all TB cases with known HIV status	18	19	3.1%	-	-	-	-	-	-
Treatment outcome									
Treatment success of all TB cases reported in 2018	20	24	63.7%	22	75.2%	46	72.7%	17	75.6%
Treatment success of new and relapse TB cases notified in 2018	21	24	73.1%	22	77.4%	46	76.5%	17	78.2%
Treatment success of childhood TB cases notified in 2018	22	26	79.9%	19	93.1%	45	89.4%	14	93.6%
Treatment success of TB/HIV cases notified in 2018	24	19	54.9%	15	51.5%	34	51.6%	14	51.6%
Treatment success of RR/MDR-TB cases enrolled in SLD treatment in 2017	26	23	45.7%	21	58.9%	44	58.6%	17	58.6%
Treatment success of all MDR-TB cases notified in 2017	27	23	46.8%	-	-	-	-	-	-
Treatment success of all XDR-TB cases notified in 2017	28	26	7.8%	19	43.9%	45	43.0%	17	43.0%

Note: European Region comprises the 53 countries of the WHO European Region and Liechtenstein.

ART: antiretroviral therapy.

DST: drug-susceptibility testing.

MDR: multidrug-resistant.

RR: rifampicin-resistant.

SLD: second-line anti-TB drugs.

XDR: extensively drug-resistant.

^a High-priority countries: the 18 high-priority countries under the STOP TB in the WHO European Region scheme are: Armenia, Azerbaijan, Belarus, Bulgaria, Estonia, Georgia, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, the Republic of Moldova, Romania, the Russian Federation, Tajikistan, Turkey, Turkmenistan, Ukraine and Uzbekistan.

^b Number of countries/areas with available data included in the statistics.

^c WHO estimates, as published in: WHO (2020). Global tuberculosis report 2020. Geneva: World Health Organization (<https://www.who.int/teams/global-tuberculosis-programme/tb-reports/global-tuberculosis-report-2020>, accessed 10 February 2021).

^d Laboratory-confirmed cases – cases with positive identification for *Mycobacterium tuberculosis* complex confirmed by culture and/or line probe assay for non-EU/EEA countries and areas. For EU/EEA countries: culture-positive OR microscopy-positive and nucleic acid amplification test-positive cases.

Table 1. Estimates of the TB disease burden, European Region, 2019

Country	Population ^a	Estimated number of deaths from TB (all forms, excluding HIV)						Estimated number of incident cases (all forms)

Note: European Region comprises the 53 countries of the WHO European Region and Liechtenstein. WHO European Region 18 TB HPCs are presented in italics. HPC: high-priority countries.

^a As published in: WHO (2013). Definitions and reporting framework for tuberculosis – 2013 revision. Geneva: World Health Organization (WHO/HTM/TB/2013.2; <https://www.who.int/tb/publications/definitions/en/>).

^b Cases with unknown previous TB history are included among new TB cases.

^c Proportion of all TB cases.

^d For the EU/EEA countries, cases with no disease site reported are included among pulmonary TB cases.

^e Proportion of all new and relapse TB cases.

^f Confirmed by culture, smear and/or nucleic acid amplification test. Microscopy results from any specimen are included for EU/EEA countries.

^g Proportion of all new and relapse pulmonary TB cases.

^h Previous TB history is defined by previous diagnosis.

ⁱ All references to Kosovo in this document should be understood to be in the context of the United Nations Security Council resolution 1244 (1999).

^a Bacteriologically confirmed cases – cases with positive identification for *Mycobacterium tuberculosis* complex confirmed by culture and/or line probe assay for non-EU/EEA countries and areas. For EU/EEA countries: cases with positive identification for *Mycobacterium tuberculosis* complex confirmed by culture and/or line probe assay.

^b For non-EU/EEA countries and areas, any resistance to isoniazid, rifampicin, ethambutol or streptomycin expressed as a percentage of cases with DST results available for at least isoniazid and rifampicin. No routine testing for ethambutol and streptomycin in all countries. For EU/EEA countries, cases with DST results for at least RIF and INH that have any resistance to isoniazid, rifampicin, ethambutol, streptomycin, ciprofloxacin, gatifloxacin, levofloxacin, moxifloxacin, ofloxacin, amikacin, capreomycin, kanamycin or pyrazinamide expressed as a percentage of cases with DST results available for at least isoniazid and rifampicin.

^c Data are considered complete when national coverage is 100% OR culture results are available for 90% of all cases, and 50% of all cases are culture-positive, and 75% of them have DST results, and external quality-assessment results have been accurate in 95% of samples of reported year.

^d Laboratory-related data from Italy are reported by NRL and may differ from data shown elsewhere in this report.

Table 12. Drug-resistance surveillance of bacteriologically confirmed^a pulmonary TB cases by previous TB treatment history, European Region, 2019

Country/area	New ...								Previously treated ...							
	cases with DST results to RIF		RR/MDR-TB cases		bacteriologically confirmed pulmonary TB cases		pulmonary TB cases		cases with DST results to RIF		RR/MDR-TB cases		bacteriologically confirmed pulmonary TB cases		pulmonary TB cases

Note: European Region comprises the 53 countries of the WHO European Region and Liechtenstein. WHO European Region 18 TB HPCs are presented in italics. The resistance pattern at the initiation of treatment is reported to TESSy irrespective of the method used for drug-susceptibility testing or resistance prediction.

DST: drug-susceptibility testing.

HPC: high-priority countries.

RIF: rifampicin.

RR/MDR: rifampicin-resistant and multidrug-resistant.

^a Bacteriologically confirmed cases – cases with positive identification for *Mycobacterium tuberculosis* complex confirmed by culture and/or line probe assay for non-EU/EEA countries and areas. For EU/EEA countries: culture-positive OR microscopy-positive and nucleic acid amplification test-positive cases.

^b Pulmonary TB cases with unknown previous TB treatment history are excluded.

^c Proportion of bacteriologically confirmed pulmonary TB cases with DST results with the respective previous TB treatment history.

^d All references to Kosovo in this document should be understood to be in the context of the United Nations Security Council resolution 1244 (1999).

^a Proportion of bacteriologically confirmed pulmonary RR/MDR-TB cases with DST results and the respective previous TB treatment history.

^b Proportion of all pulmonary TB cases with the respective previous TB treatment history.

^c Proportion of all pulmonary TB cases. For EU/EEA, excluding the cases with unknown previous TB treatment history.

^d Proportion of all bacteriologically confirmed pulmonary TB cases with DST results. For EU/EEA, excluding the cases with unknown previous TB treatment history.

^e Proportion of all bacteriologically confirmed pulmonary RR/MDR-TB cases with DST results. For EU/EEA, excluding the cases with unknown previous TB treatment history.

^f Proportion of all pulmonary TB cases. For EU/EEA, excluding the cases with unknown previous TB treatment history.

^g Proportion of all TB cases.

^h Previous TB history is defined by previous diagnosis.

ⁱ All references to Kosovo in this document should be understood to be in the context of the United Nations Security Council resolution 1244 (1999).

Note: European Region comprises the 53 countries of the WHO European Region and Liechtenstein. WHO European Region 18 TB HPCs are presented in italics. The resistance pattern at the initiation of treatment is reported to TESSy irrespective of the method used for drug-susceptibility testing or resistance prediction.

DST: drug-susceptibility testing.

HPC: high-priority countries.

MDR-TB: multidrug-resistant tuberculosis.

XDR-TB: extensively drug-resistant tuberculosis.

^a For non-EU/EEA countries and areas, cases with positive identification for *Mycobacterium tuberculosis* complex confirmed by culture and/or line probe assay; for EU/EEA countries, culture-positive OR microscopy-positive and nucleic acid amplification test-positive cases.

^b First-line DST – drug-susceptibility testing for at least two main first-line anti-TB drugs: isoniazid and rifampicin.

^c Second-line DST – drug-susceptibility testing for second-line anti-TB drugs (at least one fluoroquinolone (ciprofloxacin, gatifloxacin, levofloxacin, moxifloxacin and ofloxacin) and one injectable drug (amikacin, capreomycin and kanamycin)).

^d All references to Kosovo in this document should be understood to be in the context of the United Nations Security Council resolution 1244 (1999).

Note: European Region comprises the 53 countries of the WHO European Region and Liechtenstein. WHO European Region 18 TB HPCs are presented in italics. EU/EEA: country data are shown as missing (–) when data on treatment outcomes are not reported. For inclusion in the cohort, drug-susceptibility data are also required.

HPC: high-priority countries.

^a Cases with unknown previous TB history are included among new TB cases.

^b For non-EU/EEA countries and areas: patients started on second-line treatment are excluded. For EU/EEA countries: rifampicin-resistant TB cases are excluded.

^c In previous reports defined as "defaulted".

^d In previous reports defined as "transferred out and unknown".

^e Previous TB history is defined by previous diagnosis.

^f All references to Kosovo in this document should be understood to be in the context of the United Nations Security Council resolution 1244 (1999).

Note: WHO European Region TB high-priority countries are presented in italics. The resistance pattern at the initiation of treatment is reported to TESSy irrespective of the method used for drug-susceptibility testing or resistance prediction.
DST: drug-susceptibility testing.

MDR-TB: multidrug-resistant tuberculosis.

^a Culture-positive OR microscopy-positive and nucleic acid amplification test-positive cases.

Note: European Region comprises the 53 countries of the WHO European Region and Liechtenstein. WHO European Region 18 TB HPCs are presented in italics.

DST: drug-susceptibility testing.

HPC: high-priority country.

MDR-TB: multidrug-resistant tuberculosis.

SLD: susceptibility to second-line anti-TB drugs.

XDR-TB: extensively drug-resistant tuberculosis.

^a Includes only countries reporting second-line anti-TB drug-susceptibility testing for at least one fluoroquinolone (ciprofloxacin, gatifloxacin, levofloxacin, moxifloxacin and ofloxacin) and one injectable drug (amikacin, capreomycin and kanamycin).

[†] All references to Kosovo in this document should be understood to be in the context of the United Nations Security Council resolution 1244 (1999).

Note: European Region comprises the 53 countries of the WHO European Region and Liechtenstein. WHO European Region 18 TB HPCs are presented in italics. For non-EU/EEA countries and areas, data are for new and relapse cases only for 2015 and after.

HPC: high-priority country.

^a HIV prevalence may be underestimated due to incomplete HIV testing and/or reporting of HIV serostatus. Countries/areas were included in this analysis only if the total number of cases tested for HIV and test results were provided.

^b Proportion calculated from TB cases with known HIV test results.

^c All references to Kosovo in this document should be understood to be in the context of the United Nations Security Council resolution 1244 (1999).

Note: European Region comprises the 53 countries of the WHO European Region and Liechtenstein. WHO European Region 18 TB HPCs are presented in italics. EU/EEA: country data are shown as missing (–) when data on treatment outcomes are not reported. For inclusion in the cohort, drug-susceptibility data are also required.

HPC: high-priority country.

^a For EU/EEA countries, cases with unknown TB history are considered as new cases.

^b Excluding rifampicin-resistant cases.

^c Previous TB history is defined as previous diagnosis.

^d All references to Kosovo in this document should be understood to be in the context of the United Nations Security Council resolution 1244 (1999).

Note: European Region comprises the 53 countries of the WHO European Region and Liechtenstein. WHO European Region 18 TB HPCs are presented in *italics*. HPC: high-priority country.

^a Cases with unknown previous TB history are included among new TB cases.

^b All nucleic acid amplification tests are counted as "tested using WHO-recommended rapid diagnostics" for EU/EEA countries.

^c WHO (2013). Automated real-time nucleic acid amplification technology for rapid and simultaneous detection of TB and rifampicin resistance. Xpert MTB/RIF assay for the diagnosis of pulmonary and extrapulmonary TB in adults and children. Policy update. Geneva: World Health Organization; 2013 (<https://apps.who.int/iris/handle/10665/112472>, accessed 8 February 2021).

^d Previous TB history is defined as previous diagnosis.

^e All references to Kosovo in this document should be understood to be in the context of the United Nations Security Council resolution 1244 (1999).

8. Country profiles

Abbreviations used in country profiles

ART	antiretroviral therapy
C+	culture-positive
DRS	drug-resistance surveillance
DST	drug-susceptibility testing
MDR-TB	multidrug-resistant tuberculosis
EQA	external quality assessment
RR/MDR-TB	rifampicin-resistant and multidrug-resistant tuberculosis
RR-TB	rifampicin-resistant tuberculosis
TB	tuberculosis
XDR-TB	extensively drug-resistant tuberculosis

Albania

Population estimate 2019 by United Nations Statistical Database: 2 880 913

TB cases, 2019

Notifications

Total number of cases	412
Notification rate per 100 000	14.3
