INTRODUCTION

The 2019-21 National Family Health Survey (NFHS-5), the fifth in the NFHS series, provides information on population, health, and nutrition for India and each state and union territory. Like NFHS-4, NFHS-5 also provides district-level estimates for many important indicators. All five NFHS surveys have been conducted under the stewardship of the Ministry of Health and Family Welfare (MoHFW), Government of India. MoHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-5 was provided by the Government of India. Technical assistance and additional funding for NFHS-5 was provided by the USAID-supported Demographic and Health Surveys Program, ICF, USA. Assistance for some of the Clinical, Anthropometric, and Biochemical (CAB) tests was provided by the ICMR and the National AIDS Research Institute (NARI), Pune.

Four survey questionnaires – household, woman's, man's, and biomarker – were used to collect information in 19 languages using Computer Assisted Personal Interviewing (CAPI). All women age 15-49 and men age 15-54 in the selected sample households were eligible for interviewing. In the household questionnaire, basic information was collected on all usual members of the household and visitors who stayed in the household the previous night, as well as socioeconomic characteristics of the household, water and sanitation, health insurance, and number of deaths in the household in the three years preceding the survey. Two versions of the woman's questionnaire were used in NFHS-5. The first version (district module), which collected information on women's characteristics, marriage, fertility, contraception, reproductive health, children's immunizations, treatment of childhood illnesses, and nutrition was fielded in the entire sample of NFHS-5 households. Information on these topics is available at the district, state, and national levels. In the second version of the questionnaire (state module), four additional topics, namely, sexual behaviour, HIV/AIDS, husband's background and women's work, and domestic violence, were also included. This version was fielded in a subsample of NFHS-5 households designed to provide information only at the state and national levels. The man's questionnaire covered the man's characteristics, marriage, number of children, contraception, fertility preferences, nutrition, sexual behaviour, attitudes towards gender roles, HIV/AIDS, and lifestyle. The biomarker questionnaire covered measurements of height, weight, and haemoglobin levels for children; height, weight, waist and hip circumference, haemoglobin levels, and finger-stick blood for additional CAB testing in a laboratory for women age 15-49 and men age 15-54; and blood pressure and random blood glucose for women and men age 15 years and over. Questionnaire information and biomarkers were collected only with informed consent from the respondents.

The NFHS-5 sample was designed to provide estimates of all key indicators at the national and state levels, as well as estimates for most key indicators at the district level (for all 707 districts in India, as on 31 March, 2017). The total sample size of approximately 610,000 households for India was based on the size needed to produce reliable indicator estimates for each district. The rural sample was selected through a two-stage sample design with villages as the Primary Sampling Units (PSUs) at the first stage (selected with probability proportional to size), followed by a random selection of 22 households in each PSU at the second stage. In urban areas, there was also a two-stage sample design with Census Enumeration Blocks (CEB) selected at the first stage and

a random selection of 22 households in each CEB at the second stage. At the second stage in both urban and rural areas, households were selected after conducting a complete mapping and household listing operation in the selected first-stage units.

Readers should be cautious while interpreting and comparing the trends as some States/UTs may have a smaller sample size. Moreover, at the time of survey, *Ayushman Bharat* AB-PMJAY and *Pradhan Mantri Surakshit Matritva Abhiyan* (PMSMA) were not fully rolled out and hence, their coverage may not have been factored in the results of the percentage of households with any usual member covered under a health insurance/financing scheme and the percentage of mothers who received 4 or more antenatal care visits, respectively. Hence, the results should be interpreted with caution.

NFHS-5 fieldwork for Chhattisgarh was conducted in two parts due to the Covid-19 situation and the imposition of lockdown in all 27 districts of the state from 16th January, 2020 to 21st March, 2020 prior to the lockdown and from 5th December, 2020 to 30th March, 2021 post lockdown by Development and Research Services Pvt. Ltd. (DRS). Information was collected from 24,550 households, 28,468 women age 15-49 (including 4,244 women interviewed in PSUs in the state module), and 4,174 men age 15-54.

This report presents the key findings of the NFHS-5 survey in Chhattisgarh, followed by detailed tables and an appendix on sampling errors. At the time of finalization of this report, wealth quintiles for the country as a whole were not ready. Therefore, on finalization of the national report, the breakup of key indicators by wealth quintiles for all states will be provided as an additional document and uploaded on the official website of MoHFW and IIPS.

HOUSEHOLD CHARACTERISTICS

Important household characteristics includes household composition, housing characteristics, household possessions, access to a toilet facility, and education. The household characteristics reflect the environmental risk factors and behavioural outcomes of the household population, including their likely impact on health status.

Household composition

In Chhattisgarh, just over three-quarters (77%) of the households are in rural areas. On average, households are comprised of 4.4 members. Sixteen percent of households are headed by women, with 13 percent of the population living in female-headed households.

Ninety-seven percent of households in Chhattisgarh have household heads who are Hindu. One percent each of households have household heads who are Muslim, Christian and other religion.

Seventeen percent of households in Chhattisgarh have household heads who belong to a scheduled caste, 30 percent belong to a scheduled tribe, and 45 percent belong to an other backward class. Eight percent of household heads do not belong to a scheduled caste, a scheduled tribe, or an other backward class. The majority of households (61%) are nuclear, and 51 percent of the population reside in non-nuclear households.

Over one-quarter (26%) of Chhattisgarh's population is under age 15; only six percent is age 65 and over. The overall sex ratio of the population is 1,015 females per 1,000 males, and the sex ratio of the population under 7 years of age is lower at 947 females per 1,000 males. Ninety-six percent of persons have an *Aadhaar* card.

Among children below 18 years of age, six percent have experienced the death of one or both parents. In all, 87 percent of children below 18 years of age live with both parents, 9 percent live with one parent (mostly with their mother), and the remaining 4 percent live with neither parent. Births of almost all (97%) children under 5 years of age were registered with the civil authorities, and 85 percent of children have a birth certificate.

Death registration

Seventy-seven percent of deaths of usual household members in the three years preceding the survey were registered with the civil authorities (64 percent of deaths at age 0-4, 85 percent of deaths at age 25-34, and 80 percent of deaths at age 35 and above).

The distribution of death registrations by religion shows that 77 percent of deaths were registered among Hindus. Eighty percent of deaths were registered among other backward classes, 73 percent among scheduled castes, and 74 percent among scheduled tribes. Overall in Chhattisgarh, death registration is higher in urban (81%) than rural areas (76%) and among males (79%) than females (75%).

Disability

The respondent to the Household Questionnaire provided information for all usual household members on whether or not they have any disability in specified domains. The domains of disability are hearing, speech, visual, mental, locomotor, and other. Nearly one percent (0.9%) of the *de jure* household population has any disability. The most prominent type of disability is locomotor (0.4%). Men are slightly more likely than women to have any disability (1.1% men compared with 0.7% women). The proportion of household members who have any disability rises with increasing age. For instance, almost two percent of the female household members age 70 and over are reported to have any disability, compared with less than one percent of household members in the younger age groups.

Housing characteristics

Over two-fifths (43%) of households in Chhattisgarh live in a *pucca* house and almost all households (99%) have electricity. Ninety-two percent of households in Chhattisgarh have basic drinking water service, and 96 percent of households use an improved source of drinking water, but only 41 percent have water from tube well or borehole. Rural households (47%) are more likely than urban households (22%) to have water from tube well or borehole. Thirty-seven percent of households use an appropriate treatment method to make drinking water potable (mostly by straining water through cloth). One-third of households (33%) in Chhattisgarh use a clean fuel for cooking.

Over two-fifths (41%) of households in Chhattisgarh have water from tube well or borehole.

Access to toilet facility

Safe sanitation is one of the foundations of a healthy, comfortable, and dignified life. Households without proper sanitation facilities have a greater risk of diseases like diarrhoea, dysentery, and typhoid than households with improved sanitation facilities that are not shared with other households.

Fifteen percent of all households (19% in rural areas and 4% in urban areas) do not use any sanitation facility; they use open spaces or fields. In Chhattisgarh, 86 percent of households have access to a toilet facility, with a much higher accessibility in urban areas (96%) than in rural areas (83%). Access to a toilet facility ranges from 77 percent among scheduled tribe households to 94 percent among households which are not scheduled caste, scheduled tribe, or other backward class households. Access to a toilet facility varies widely across the districts, ranging from 37 percent in Bijapur district (much lower (33%) in the rural areas) to almost 97 percent in Durg districts. At least 99 percent of urban households have access to a toilet facility in seven districts (Baloda Bazar, Durg, Surguja, Uttar Bastar Kanker, Mungeli, Bastar, and Kabeerdham).

Selected household possessions

In Chhattisgarh, two-thirds of households own a house (66% of rural households and 64% of urban households). Almost all urban households (93%) and most rural households (84%) in Chhattisgarh have a mobile phone. Ninety-five percent of households have a bank or post office account. Fifty-five percent of households own either a motorcycle or a scooter. BPL cards are held by 87 percent of households. Irrigated land is owned by 42 percent of rural households and 11 percent of urban households. Overall, 53 percent of all households in Chhattisgarh own agricultural land, and over half of households (51%) own farm animals.

Background characteristics of respondents

Thirty-five percent each of women and men are in the 15-24 age group, while 30 and 29 percent of women and men, respectively, are in the 25-34 age group. Over three-quarters (76%) of both women and men are in rural areas.

In NFHS-5, literate persons are those who have either completed at least standard 9 or passed a simple literacy test conducted as part of the survey. According to this measure, 73 percent of women age 15-49 and 83 percent of men age 15-49 are literate.

Twenty-two percent of women and 10 percent of men age 15-49 have never been to school. Only 23 percent of women age 15-49 in Chhattisgarh have completed 12 or more years of schooling, compared with 27 percent of men.

Media exposure is quite widespread among women and men in Chhattisgarh. Fifty-five percent of men and 60 percent of women watch television at least once a week. Men (25%) are much more likely than women (13%) to read a newspaper or magazine at least once a week. Thirty-five percent of men and 37 percent of women are not regularly exposed to print media or other forms of media.

Women are more likely than men to be currently married (66% versus 59%) or widowed (3% versus 1%), while men are more likely than women to be never married (39% versus 29%).

A majority of female respondents are Hindus (97%), while one percent each are Muslims, and Christians.

Forty-nine percent of female respondents belong to an other backward class, while 30 percent belong to a scheduled tribe. Fourteen percent both of women and men belong to a scheduled caste, while 8 percent both of men and women 15-49 do not belong to a scheduled caste, a scheduled tribe, or an other backward class.

Fifty-three percent of women and 16 percent of men age 15-49 were not employed in the 12 months preceding the survey. Four percent of women and 41 percent of men were engaged in an agricultural occupation, while 41 percent of women and 40 percent of men were employed in a non-agricultural occupation.

EDUCATION

In NFHS-5, information related to preschool attendance has been collected for the first time, in addition to school attendance among children age 6-17 years and educational attainment of other members of the household, including reasons for drop-out in the case of those who discontinued education.

Preschool attendance

In India many children attend *anganwadi* centres that provide spaces for children to learn, play, eat nutritious food, and develop the skills needed for a lifetime of learning. Attending pre-primary education, such as at an *anganwadi* centre, improves children's school readiness by providing quality learning through interactive play methods with qualified instructors. Also, parents or guardians can go to work at ease if children are enrolled in pre-primary education.

In Chhattisgarh, twenty-two percent of boys and 24 percent girls age 2-4 years attend preschool. Preschool attendance is equal among children in nuclear households and non-nuclear households (23%). Preschool attendance is higher among children in households headed by Christian (24%) than households headed by Hindus (23%) and Muslims (15%). Preschool attendance is highest among scheduled tribe households (24%), slightly lower among other backward class households (23%), and lowest in households scheduled caste (21%). Preschool attendance is equal in households with 3-5 members and households with 6 or more members (23% each). Overall, urban households (28%) show higher preschool attendance than rural households (22%). Preschool attendance is highest in Bastar district (47%) and lowest in Surajpur district (10%).

School attendance among children

Eighty-five percent of children age 6-17 years in Chhattisgarh attend school (89% in urban areas and 84% in rural areas). School attendance is almost universal (94%) at age 6-14 years, but drops sharply to 61 percent at age 15-17 years. There is a little gender disparity in school attendance in the 6-14 year age group; however, in the age group 15-17 years, 64 percent of girls compared with 59 percent of boys are attending school.

Are there gender differentials in children's school attendance?

Percentage of children attending school by age

FERTILITY

This section provides trends in the total fertility rate, age at marriage, pregnancy outcomes, teenage pregnancy, birth interval, the desire for more children, and son preference. NFHS-5 estimates on the median age at marriage, total fertility rate, and teenage motherhood illustrated in this section can help in setting benchmarks for the Sustainable Development Goals at the subnational level.

Age at first marriage

In Chhattisgarh, the median age at first marriage is 20.3 years among women age 25-29 years and 19.3 years among women age 20-49 years. Only 15 percent of women age 20-49 years have never married, compared with 26 percent of men age 20-49 years. Twelve percent of women age 20-24 years got married before attaining the legal minimum age of 18 years, down from 21 percent in NFHS-4. Fifty percent of women age 20-24 years are never married, compared with 80 percent of men in the same age group, showing that the age at marriage is much lower for women than men in Chhattisgarh.

Fertility levels

The total fertility rate (TFR) in Chhattisgarh is 1.8 children per woman, which is well below the replacement level of fertility. Fertility has decreased by 0.4 children between NFHS-4 and NFHS-5.

The total fertility rate in urban areas, at 1.4 children per woman, and in rural areas, at 1.9 children per woman, are both below the replacement level. Among births in the three years preceding the survey, 10 percent were of birth order four or higher, compared with 12 percent in NFHS-4.

The greatest differentials in fertility are by religion, caste/tribe, and schooling. At current fertility rates, women with no schooling will have an average of 0.7 more children than women with 12 or more years of schooling. The total fertility rate among Hindu and Muslim women is almost same (1.8 and 1.7 children per women, respectively). However, Muslim women will have an average of 0.3 children less than Christian women (a TFR of 1.7, compared with 2.1), and 0.5 children less than women belonging to other religions (a TFR of 2.2).

How does fertility vary with schooling? Total fertility rate (children per woman)

Pregnancy outcome

Ninety-three percent of last pregnancies in the five years preceding the survey ended in a live birth, and the remaining 7 percent terminated in foetal wastage (abortion, miscarriage, or stillbirth). Miscarriage is the most commonly reported type of foetal wastage, accounting for 4 percent of all pregnancies, and abortions accounted for 2 percent.

The two main reasons for seeking abortion reported by women were unplanned pregnancy (32%) and last child too young (25%). The most common methods used for performing abortions were medicines (88%), other surgical methods (4%), and manual vacuum aspiration (MVA) (3%). A large majority (43%) of abortions were performed at home, 33 percent of abortions were performed in the private health sector and 24 percent were performed in the public health sector. Fourteen percent of women reporting an abortion reported having complications from the abortion. Most abortions (44%) in Chhattisgarh are performed by self.

Teenage pregnancy

Among young women age 15-19 in Chhattisgarh, three percent have already begun childbearing, that is, they have already had a live birth or are pregnant with their first child, which is five percent in NFHS-4. The proportion of women who have started childbearing rises sharply from one percent at age 17 years to 4 percent among women age 18 years and to 12 percent among women age 19 years. The proportion who have started childbearing is much higher among young women who had less than 5 years of schooling or no schooling (9% each) than among those with 12 or more years of schooling (2%).

Birth intervals

The median interval between births in the five years before the survey in Chhattisgarh is 34.5 months. Seven percent of births take place within 18 months of the previous birth and 21 percent occur within 24 months. The proportion of births occurring within 24 months of a previous birth is particularly high (26%) for mothers age 20-29 and for births occurring after a deceased sibling (44%). More than half (54%) of all births occur within three years of the previous birth. Research

shows that waiting at least three years between children reduces the risk of infant mortality and has a positive impact on maternal health.

More than half (54%) of births in Chhattisgarh occur within three years of the previous birth.

Fertility preferences

Seventy-one percent both of currently married women and men age 15-49 years want no more children, are already sterilized, or have a spouse who is sterilized. Among those who want another child, forty-five percent of women and 46 percent of men would like to wait at least two years before the next birth. Seventy-two percent of women and 75 percent of men consider the ideal family size to be two or fewer children.

In Chhattisgarh, there is a strong preference for sons. Sixteen percent of women and men want more sons than daughters, but only 5 percent of women and men want more daughters than sons. However, eighty-three percent of women and 88 percent of men would like to have at least one son and over four-fifths want at least one daughter (81% of women and 86% of men).

Women's desire for more children is strongly affected by their current number of sons. For example, among women with two children, 93 percent with 2 sons want no more children, compared with 58 percent with two daughters who want no more children. Notably, eighty-five percent of currently married women and men with two children who want no more children irrespective of their number of sons has almost unchanged (83% versus 81%) in the 4 years since NFHS-4.

In Chhattisgarh, unplanned pregnancies are fairly common. If all women were to have only the number of children they wanted, the total fertility rate would have been 1.6 children per woman, instead of the current level of 1.8 children per woman.

Current sex composition of families with two living children

FAMILY PLANNING

The family planning section covers trends in contraceptive knowledge and current use, informed choice, and unmet need for family planning methods among women age 15-49 years. It also includes information on men's attitude towards women using a contraceptive method. As in previous rounds of the survey, NFHS-5 provides estimates of the contraceptive prevalence rate and unmet need for family planning.

Contraceptive knowledge and use

Knowledge of contraception is almost universal in Chhattisgarh. However, some methods are still less well known. Only seventy-eight percent of currently married women know about the lactational amenorrhoea method (LAM) and 31 percent know about female condoms. Among all women, only 52 percent know about emergency contraception.

The contraceptive prevalence rate (CPR) among currently married women age 15-49 is 68 percent, only a slight increase from NFHS-4 (58%). The use of modern family planning methods (62%) has also increased slightly from its level in NFHS-4 (55%). The use of female sterilization has increased slightly, from 46 percent to 48 percent between NFHS-4 and NFHS-5; the share of female sterilization in overall contraceptive use has fluctuated between 70 and 80 percent in last four round of

surveys. Contraceptive use in NFHS-5 increases sharply with age, from 16 percent for women age 15-19 to 80 percent for women age 40-49.

In Chhattisgarh, contraceptive use shows little difference in rural and urban areas. Contraceptive prevalence decreases with increasing schooling of women. Fifty-nine percent of currently married women with no schooling or less than 5 years of schooling use female sterilization, compared with only 26 percent of women with 12 or more years of schooling. Muslim women (66%) are less likely to use contraception than Hindu (68%).

Women in Chhattisgarh are much more likely to use contraception if they already have a son. For example, among women with two children, 82 percent with at least one son use a method of family planning, compared with 61 percent of women with two daughters and no sons.

The most common modern spacing methods used by currently married women in Chhattisgarh are condoms (4%), followed by the IUD or PPIUD (3%). In general, urban women and better-educated women are more likely than other women to use spacing methods.

Ninety percent of sterilized women had their sterilization operation in the public sector, mainly in a government or municipal hospital, and 11 percent of IUD or PPIUD users had their IUD insertion in the private sector.

The majority of pill and condom/*Nirodh* users get their supply from the public health sector or other source, including a shop. Nonetheless, over two-thirds of pill users (68%) and 40 percent of condom/*Nirodh* users get their supply from the public sector.

The 12-month discontinuation rate for any reason is fifty percent for all contraceptive methods. Sixty-one percent of users of modern spacing methods discontinued use within the first year after they adopted the method. The most common reason for discontinuation is wanted more effective method.

Sixty-one percent of users of modern spacing methods discontinued use within the first year after they adopted the method.

Informed choice

Women who know about all available contraceptive methods and their side effects can make better choices about what method to use. Eighty-eight percent of users of selected modern contraceptive methods were ever told by a health or family planning worker about other methods they could use. Eighty-three percent were told about the possible side effects or problems with their method, and even lesser (78%) were told what to do if they experienced any side effects.

Men's attitudes

Nearly two-fifths (39%) of men age 15-49 in Chhattisgarh agree that contraception is women's business and a man should not have to worry about it. However, only 13 percent of men think that women using contraception may become promiscuous. Over half of men (54%) know that a condom, if used correctly, protects against pregnancy most of the time.

Contraceptive Prevalence Rate by District *Percentage of currently married women*

Unmet need

Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop childbearing entirely, but are not using contraception. According to this definition, eight percent of currently married women have an unmet need for family planning, declined since NFHS-4 (11%). Currently, 89 percent of the demand for family planning is being satisfied and 81 percent of the demand is being satisfied by modern methods.

INFANT AND CHILD MORTALITY

The mortality rate among children under age 5 years including neonatal, postneonatal, and infant mortality rates is an important indicator that measures the overall well-being of a country. The infant mortality rate in Chhattisgarh in NFHS-5 is estimated at 44 deaths before the age of one year per 1,000 live births, down from the NFHS-4 estimate of 54, the NFHS-3 estimate of 71, and the NFHS-2 estimate of 81. The under-five mortality rate (U5MR) is estimated to be 50 deaths before five years of age per 1,000 live births, declined since NFHS-4 (64 per 1,000).

As expected, boys generally have higher mortality rates than girls, especially during the postneonatal period. Girls have a slightly higher mortality rate than boys during the neonatal period (in the first month after birth).

Note: Category "Mother's age at birth 40-49" not shown since there are fewer than 250 unweighted person-years of exposure to the risk of death.

Children born to mothers over age 30 are more likely to die during infancy than children born to mothers in the prime childbearing age (<30 years). Infant mortality is 55 per 1,000 live births for older mothers and 38 per 1,000 live births for teenage mothers, compared with 43 per 1,000 live births for mothers age 20-29.

Infant mortality rates are also higher for scheduled castes (54 per 1,000 live births) than scheduled tribes (58 per 1,000 live births) and other backward classes (35 per 1,000 live births). The infant mortality rate has decreased in rural and urban areas from NFHS-4 to NFHS-5. The infant mortality rate is higher for children whose mothers have no schooling than for mothers who have more than 10 years of schooling or less than 10 years of schooling at all.

Children born to the older mothers are more likely to die during infancy than to mothers age less than 20.

MATERNAL HEALTH

Maternal health is an important aspect for the development of any country in terms of increasing equity and reducing poverty. The survival and well-being of mothers are not only important in their own right, but are also central to solving broader economic, social, and developmental challenges. Maternal health care services are essential for the health and wellbeing of mothers, as well as their children, affecting the overall population and its health and nutritional status. This section describes the utilization of antenatal care, delivery care, and postnatal care by women who reported their last births in the five years preceding the survey. It also shows the extent of male involvement in maternal health care.

Antenatal care

Among mothers who gave birth in the five years preceding the survey, 85 percent received antenatal care for their last birth from a health professional (41% from a doctor and 45% from an auxiliary nurse midwife (ANM), lady health visitor (LHV), nurse, or midwife). Five percent did not receive any antenatal care (ANC). Among mothers who gave birth in the five years preceding the survey, 96 percent registered the pregnancy for the most recent live birth. Among registered pregnancies, the 97 percent received a Mother and Child Protection Card (MCP Card).

Two-thirds of women received antenatal care during first the trimester of pregnancy, as is recommended. Sixty percent of mothers had four or more antenatal care visits.

Sixty percent of mothers in Chhattisgarh had at least four antenatal care visits for their last birth.

Urban women were more likely to have four or more antenatal care visits than rural women. Since NFHS-4, there has been decrease in the percentage of mothers who had an antenatal check in the first trimester (from 71% to 66%) and a slight increase in the proportion of women who had four or more antenatal care visits (from 59% to 60%). For 93 percent of their last births, mothers received iron and folic acid (IFA) supplements, but only 45 percent consumed them for the recommended 100 days or more and only 26 percent consumed them for the newly recommended 180 days or more. Ninety-two percent of last births were protected against neonatal tetanus through tetanus toxoid vaccinations given to the mother. Forty-nine percent of mothers took an intestinal parasite drug during pregnancy.

Among women with a live birth in the five years preceding the survey who met with a community health worker in the last three months of pregnancy for their most recent live birth, more than 9 in 10 received advice on each of five different areas (98% received advice on breastfeeding, 97% on keeping the baby warm, 96% on the importance of institutional delivery, 95% on cord care, and 93% on family planning).

Even when women receive antenatal care, sometimes they do not receive all the services needed to monitor their pregnancy. In Chhattisgarh, more than 95 percent of women who received antenatal care for their last birth received each of the services needed to monitor their pregnancy: having their weight taken and their blood pressure measured (99% each), having a blood sample taken and their abdomen examined (97% each), and having a urine sample taken (96%).

An ultrasound test was performed in case of 70 percent of pregnancies in the five years preceding the survey. Women with at least 10 or more years of schooling were much more likely to have an ultrasound test than women with no schooling. Eighty-five percent of women with at least 12 years of schooling had an ultrasound test compared with 50 percent of women with no schooling. Pregnant women with no sons were much more likely to have an ultrasound test than those with at least one son. For example, among women with two children, those with no sons (64%) were more likely to have an ultrasound test during their next pregnancy than those who had at least one son (53%).

Delivery care

Eighty-six percent of births take place in a health facility (mostly a government facility) and 14 percent take place at home. The percentage of births in a health facility increased in the 4 years from 70 percent (NFHS-4) to 86 percent (NFHS-5). Institutional births are more common among women who have received an antenatal check, women with 10 or more years of schooling, women who are having their first birth, and urban women.

For 95 percent of home births, a clean blade was used to cut the cord, as is recommended. A disposable delivery kit was used for 58 percent

of deliveries. Ninety-three percent of home births followed the recommendation that the baby should be immediately wiped dry and then wrapped without being bathed first.

Eighty-six percent of children in Chhattisgarh who were born in the past five years were born in a health facility.

Eighty-nine percent of births during the past five years took place with assistance from a skilled provider, and another 6 percent were delivered by a traditional birth attendant.

Fifteen percent of births during the past five years were delivered by caesarean section. Fifty-one percent of caesarean sections (8% of all births with C-section) were emergency caesarean sections.

Institutional Delivery by District *Percentage of births in the past five years*

Among women who had a live birth in the five years preceding the survey that was delivered in a health facility, 47 percent received financial assistance under *Janani Suraksha Yojana* (JSY). Rural women (50%) were more likely than urban women (36%) to receive financial assistance under JSY. Scheduled tribe women (54%) and scheduled caste women (47%) were more likely than women from any other caste/tribe group to receive financial assistance under JSY.

Postnatal care

Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. In Chhattisgarh, 92 percent of mothers had a postnatal check after their last birth and 89 percent of mothers had a postnatal check within two days of the birth, as is recommended. Postnatal care is most common for births in a health facility; ninety-two percent of births in public health facilities and 94 percent of births in private health facilities were followed by a postnatal check for the mother within two days of birth, compared with 68 percent of home births.

Eighty-five percent of last births in the five years preceding the survey received a health check in the first two days after birth. Only 41 percent of home births received a health check in the first two days after birth.

Male involvement in maternal care

Ninety-seven percent of men with a child under three years of age said that the youngest child's mother received antenatal care. Eighty-four percent of men with a child under three years said they were present during at least one antenatal check received by the child's mother (81% in urban areas and 84% in rural areas), but only 80 percent were told by a health provider or health worker what to do if the mother had a pregnancy complication. Only 70-80 percent of men were told about the signs of specific pregnancy complications (vaginal bleeding, convulsions, high blood pressure, prolonged labour, and severe abdominal pain).

Most fathers with a child less than three years of age were given information about various aspects of maternal care. Eighty-nine percent of men were told about the importance of proper nutrition for the mother during pregnancy and 80 percent of men told the importance of delivering the baby in a health facility. Seventy-four percent of men were told by a health provider or a health worker about family planning or delaying the next child.

CHILD HEALTH

Vaccination of children

Vaccinations are considered as the most cost-effective intervention that can improve the overall health of children. Eighty percent of children age 12-23 months received all basic vaccinations against six major childhood illnesses (tuberculosis, diphtheria, pertussis, tetanus, polio, and measles) at any time before the survey. However, 97 percent of children are at least partially vaccinated; only 3 percent have not received any vaccinations at all. Vaccinations were recorded from a vaccination card for a large majority (91%) of children, which is a substantial increase since NFHS-4 (72%).

Ninety-six percent of children have received a BCG vaccination. However, over four-fifths (84%) have received the recommended three doses of polio vaccine, 88 percent have received the three recommended doses of DPT or Penta vaccine, and 90 percent have been vaccinated against measles. There is considerable dropout between the first and third doses of DPT vaccine (from 95% to 88%) and polio vaccine (from 95% to 84%). It should be noted that the Penta vaccine was not widely available at the time of the NFHS-4 survey.

Between NFHS-4 and NFHS-5, there was decrease in vaccination coverage for three doses of DPT (from 91% to 88%), measles (from 94% to 90%), and BCG (from 98% to 96%). The coverage for three doses of polio vaccine also increased, from 82 percent to 84 percent. Overall, there was a slight change in the coverage of all basic vaccinations (from 76% to 80%). In addition, over ninetenths (94%) of children have received at least one dose of hepatitis B vaccine, and 86 percent of children have received all three recommended doses of hepatitis B vaccine.

Coverage of All Basic Vaccinations by District *Percentage of children 12-23 months*

Note: Figures in parentheses are based on 25-49 unweighted cases.

Coverage with all basic vaccinations have slight difference in boys and girls (79% versus 80%) and for rural areas and urban areas (80% versus 77%). Coverage with all basic vaccinations is higher among children from other backward class (83%) than children from any other caste/tribe group.

Childhood illnesses

In the two weeks before the survey, 2 percent of children under age five years had symptoms of an acute respiratory infection (cough accompanied by (1) short, rapid breathing that is chest related and/or (2) difficult breathing that is chest related). Of these children, 36 percent were taken to a health facility or health provider.

Six percent of children under age five were reported to have had fever in the two weeks preceding the survey; 73 percent of these children were taken to a health facility or provider for treatment.

Overall, 4 percent of children under age five years had diarrhoea in the two weeks preceding the survey. Seventy-four percent of these children were taken to a health facility or health provider. Ninety-eight percent of mothers of young children have heard of oral rehydration salt (ORS) packets for the treatment of diarrhoea, but only 67 percent of children with diarrhoea were given ORS. Thirty-eight percent of children with diarrhoea were given gruel and over three-quarters (77%) were given any type of oral rehydration therapy (ORT). Forty percent were given zinc supplements. Eleven percent of children with diarrhoea did not receive any type of treatment at all.

To reduce dehydration and minimise the effects of diarrhoea on nutritional status, it is recommended that normal feeding of children be continued when they have diarrhoea and that the amount of fluids given should be increased. However, in Chhattisgarh only 5 percent of children with diarrhoea received more to drink than normal. Only 25 percent of children received the same amount to drink as usual. Of greater concern, more than two-thirds (70%) of children with diarrhoea were given less to drink or nothing at all to drink. Only 29 percent of children with diarrhoea were given the same amount of food or more food, as recommended.

Integrated Child Development Services (ICDS)

The ICDS programme provides nutrition and health services for children under age six years and pregnant or breastfeeding women, as well as preschool activities for children age 3-5 years. These services are provided through community-based *anganwadi* centres.

Eighty percent of children under 6 years received services of some kind from an anganwadi centre in the 12 months preceding the survey. The most common services that age-eligible children receive are growth monitoring (79%), supplementary food (78%), health check-ups (74%), and immunizations (67%). The service that is least likely to be accessed is early childhood care or

preschool (65%). Slightly more than four out of five (85%) mothers of children who were weighed at an *anganwadi* centre received counselling from an *anganwadi* worker or an ANM. Among children under age 6 years, eighty-seven percent of their mothers received any service from an *anganwadi* centre during pregnancy, and over four-fifths of their mothers (84%) received any service while breastfeeding.

BREASTFEEDING, NUTRITION, AND ANAEMIA

Infant feeding

Although breastfeeding is nearly universal in Chhattisgarh, only 80 percent of children under 6 months are exclusively breastfed, as the World Health Organization (WHO) recommends. Ninetytwo percent are put to the breast within the first day of life, but only 32 percent started breastfeeding in the first hour of life (as recommended). While exclusive breastfeeding indicators show an improvement since NFHS-4, many infants are still deprived of the highly nutritious first milk (colostrum) and the antibodies it contains.

It is recommended that nothing be given to children other than breastmilk even in the first three days when the milk has not begun to flow regularly because prelacteal feeds limit the frequency of suckling by the infant and expose the baby to the risk of infection. However, only 7 percent of children are given something other than breastmilk during the first three days. Overall, 96 percent of children continue breastfeeding at 1 year and over nine-tenths (91%) continue breastfeeding up to 2 years.

After the first 6 months, breastmilk is no longer enough to meet the nutritional needs of infants. Therefore, complementary foods should be added to the diet of the child. However, at age 6-8 months, only 41 percent of children in Chhattisgarh receive breastmilk and complementary foods.

WHO has several recommendations for infant and young child feeding (IYCF) practices for children age 6-23 months. The key IYCF indicators measure the adequacy of dietary diversity and meal frequency for breastfed and non-breastfed children. Only thirty percent of children age 6-23 months are fed the recommended minimum number of times per day and even fewer (20%) are fed from the appropriate number of food groups. Only 9 percent are fed according to all three recommended practices.

Micronutrient deficiency is a major contributor to childhood morbidity and mortality. Vitamin A is an essential nutrient for the immune system. Severe vitamin A deficiency (VAD) can cause eye damage and a higher risk of dying from measles and diarrhoeal disease. The Government of India recommends that children under 5 years of age receive vitamin A supplements every six months, starting at age 9 months. In Chhattisgarh, more than four-fifths (85%) of children age 9-35 months were given a vitamin A supplement in the past six months, but only half of youngest children age 6-23 months living with their mother ate vitamin A-rich foods during the day or night before the survey.

Iron deficiency is a primary cause of anaemia. Eating foods rich in iron and taking iron supplements can help prevent anaemia. Seventeen percent of children age 6-23 months ate iron-rich foods during the day or night before the survey; however, 56 percent of children in the same age group were given iron supplements in the week before the survey.

Children's nutritional status

Childhood undernutrition contributes to childhood diseases and is a major cause of child mortality in India. Thirty-five percent of children under age five years are stunted, or too short for their age, which indicates that they have been undernourished for some time. Nineteen percent are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness causing weight loss, and 8 percent are severely wasted. Thirty-one percent are underweight, which takes into account both chronic and acute undernutrition. Even during the first six months of life when almost all babies are breastfed, 23 percent of children are stunted, 26 percent are wasted, and 30 percent are underweight.

Children's nutritional status in Chhattisgarh has hardly changed since NFHS-4 by all measures. The percentage of children who are stunted decreased marginally from 38 percent to 35 percent in the 4 years between NFHS-4 and NFHS-5. The percentage of children who are underweight (31%) or wasted (19%) has decreased since NFHS-4. However, the continuing high levels of undernutrition are still a major problem in Chhattisgarh.

Note: Nutritional status estimates are based on the 2006 WHO International Reference Population

Differences in the levels of malnutrition are more pronounced for several background characteristics. Malnutrition generally decreases with increasing mother's schooling, better nutritional status of the mother, and child's size at birth. The level of undernutrition is relatively high for rural children and children of higher birth orders. It is generally higher among scheduled tribe children than among children belonging to any other caste/tribe group and lower among Muslim children than among children of any other religion. Malnutrition is somewhat higher for male children than female children on all three nutritional status measures.

Adults' nutritional status

Malnutrition refers to deficiencies, excesses, or imbalances in a person's intake of energy and/or nutrients, and includes undernutrition as well as overweight and obesity. The body mass index (BMI), which is defined as a person's weight in kilograms divided by the square of the person's height in metres, is a measure that indicates the nutritional status in adults.

More than one-third (37%) of women and 32 percent of men are either too thin or overweight or obese. Among women age 15-49, the proportion overweight or obese is 14 percent, which is slightly lower in NFHS-4 (12%). More men are thin (17%) than overweight or obese (15%). Twenty-three percent of women in Chhattisgarh are too thin. Over three-fifths of women (63%) and 68 percent of men are at a healthy weight for their height. Undernutrition is particularly common in

the younger age groups (especially age 15-19), in rural areas for women, and among scheduled tribes. Overweight and obesity are most prevalent in older adults, those in urban areas, and more educated men.

How many women are at a healthy weight for their height? Percent distribution of women

For the first time, the 2019-21 NFHS measured the waist circumference and hip circumference of women and men age 15-49 years. This information was used to calculate the waist-to-hip ratio (WHR). WHR helps to identify the distribution of body fat and predicts abdominal obesity. Abdominal obesity is associated with an increased risk of type 2 diabetes mellitus, myocardial infarction, stroke, and premature death.

Fifty-five percent of women and 44 percent of men have a waist-to-hip ratio (WHR) that puts them at a substantially increased risk of metabolic complications. The proportion of adults with an increased risk WHR increases with age, from 48 percent for women age 15-19 to 63 percent for women age 40-49, and from 29 percent for men age 15-19 to 56 percent for men age 40-49. The proportion of women having a substantially increased risk WHR is much higher in urban areas (65%) than in rural areas (53%) and among men it is only somewhat higher in urban areas (48%) than in rural areas (43%).

The use of iodized salt prevents iodine deficiency, which can lead to miscarriage, goitre, and mental retardation. Almost all households (99%) with tested salt were using iodized salt at the time of the survey.

Anaemia

Anaemia is a condition that is marked by low levels of haemoglobin in the blood. Iron deficiency is estimated to be responsible for about half of all anaemia globally, but anaemia can also be caused by malaria, hookworms and other helminths, other nutritional deficiencies, chronic infections, and genetic conditions. Anaemia can result in maternal mortality, weakness, diminished physical and mental capacity, increased morbidity from infectious diseases, perinatal mortality, premature delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement. Anaemia is a major health problem in Chhattisgarh, especially among women and children.

More than two-thirds (67%) of children age 6-59 months are anaemic. This includes 29 percent who are mildly anaemic, 37 percent who are moderately anaemic, and 2 percent who have severe anaemia. The overall prevalence of anaemia in children increased from 42 percent in NFHS-4 to 67 percent in NFHS-5. There is a little difference in the prevalence of anaemia among girls and boys. Children of mothers who have anaemia are much more likely to be anaemic. Although anaemia levels vary somewhat according to background characteristics, anaemia among children is widespread in every group. Over two-thirds (71%) of children in Chhattisgarh are anaemic even if their mother has no schooling or less than 5 years of schooling.

Sixty-one percent of women in Chhattisgarh have anaemia, including 27 percent with mild anaemia, 31 percent with moderate anaemia, and 3 percent with severe anaemia. Anaemia is particularly high among rural women, and scheduled tribe women, but anaemia exceeds 51 percent for every group of women. Anaemia among women has increased by 14 percentage points since NFHS-4. Over one-quarter (27%) of men in Chhattisgarh are anaemic. Scheduled tribe men, men with no schooling, men age 40-49, and men in rural areas are particularly likely to be anaemic.

ADULT HEALTH AND HEALTH CARE

Tuberculosis

Tuberculosis is an infectious disease caused by a type of bacterium called Mycobacterium tuberculosis, which primarily affects the lungs. Tuberculosis is transmitted from person to person through the air, and people with lowered immunity, HIV, malnutrition, diabetes, and those who use tobacco or alcohol have higher chances of getting tuberculosis. Tuberculosis is both preventable and curable, however mortality is high if not treated properly. In Chhattisgarh, 112 persons per 100,000 are estimated to have medically treated tuberculosis, based on reports from household respondents. The prevalence of medically treated tuberculosis is lower among men (107) than among women (116) and is higher in rural areas (119) than in urban areas (86).

A large majority of respondents have heard of tuberculosis (93% of women and 94% of men), but even among those who have heard of tuberculosis, only 75 percent of women and 82 percent of men know that it is spread through the air by coughing or sneezing. About two-thirds (65%) of women and 64 percent of men have misconceptions about how tuberculosis is spread. Overall, 95 percent each of women and men know that tuberculosis can be cured, and only 11 percent of women and 10 percent of men say that if a family member had tuberculosis, they would want to keep it a secret.

Diabetes, asthma, goitre, heart disease, and cancer

According to self-reports, 909 women and 1,268 men age 15-49 per 100,000 have diabetes. Overall, 575 women and 530 men per 100,000 have asthma. The prevalence of asthma among women and men is higher in older age groups, and those who have less schooling. Goitre is more common than asthma or diabetes among women, but less common than asthma or diabetes among men (903 women and 177 men per 100,000). The prevalence of any heart disease is lower among women (331 per 100,000) than among men (438 per 100,000). Among the five diseases, cancer is the least common, with 174 women and 189 men per 100,000 reportedly having cancer.

Blood pressure (hypertension)

Blood pressure is the force exerted by circulating blood against the arterial walls. Hypertension or high blood pressure is a condition in which the blood vessels have persistently raised pressure. Hypertension is a major risk factor for cardiovascular diseases, chronic kidney diseases, and brain diseases, and it is a major cause of premature deaths worldwide. Some of the risk factors for developing hypertension are unhealthy diets, physical inactivity, alcohol and tobacco consumption, and excess body weight.

Fourteen percent of women age 15-49 in Chhattisgarh have hypertension, including 10 percent with Stage 1 hypertension, 2 percent with Stage 2, and 1 percent with Stage 3 hypertension. Hypertension also includes women with normal blood pressure who are taking medicine to lower their blood pressure. Forty-seven percent of women have normal blood pressure.

The prevalence of hypertension among men age 15-49 is somewhat higher than among women. Twenty-one percent of men in Chhattisgarh have hypertension, including 16 percent with Stage 1 hypertension, 3 percent with Stage 2 hypertension, and 2 percent with Stage 3 hypertension. Hypertension also includes men with normal blood pressure who are taking medicine to lower their blood pressure. Twenty-eight percent of men have normal blood pressure. For both women and men, hypertension increases with age.

Blood glucose

Diabetes mellitus is a chronic metabolic disease characterized by elevated levels of blood glucose. Diabetes over a period of time can cause severe damage to the heart, blood vessels, retina, kidneys, and nerves, and it puts sufferers at increased risk of various infectious and non-infectious diseases. Early diagnosis, determined by blood glucose testing, and adequate treatment are the key steps for managing diabetes and its complications. NFHS-5 has included random blood glucose measurement using capillary blood among women and men age 15 and above.

In Chhattisgarh, 3 percent of women age 15-49 have high blood glucose levels, and an additional 2 percent have very high blood glucose levels. In comparison, 4 percent of men age 15-49 have high blood glucose levels and an additional 3 percent have very high blood glucose levels. Women and men in older age groups have relatively high blood glucose levels.

More than 9 in 10 women (95%) and men (93%) age 15-49 have normal blood glucose levels. Men are more likely than women to have normal blood glucose levels and to be taking medicine to lower their blood glucose level (0.9% of men versus 0.4% of women). Six percent of women and 8 percent of men have high or very high blood glucose levels or are taking medicine to lower their blood glucose level.

Screening tests for cancer

Cancer is a group of diseases with high mortality, and it is the second leading cause of death globally. The chances of successful treatment of cancer increase if diagnosed early. One way of early detection is screening, which is identification of unrecognized disease by using simple tests or examinations among those individuals who have the disease but do not yet have symptoms. NFHS-5 collected information about whether women had ever undergone a screening test for cancer of the oral cavity, breast, and cervix.

In Chhattisgarh, less than 1 percent of women age 15-49 have ever undergone a screening test for cancer of the cervix (0.4%), ever undergone a screening test for breast cancer (0.2%), and ever undergone a screening test for cancer of the oral cavity (0.2%), which is slightly higher in men (1%).

Health insurance

Universal access to health care is the absence of any barriers in health care, including economic barriers. Adequate coverage by health insurance protects a person from financial hardships because of the costs of health care. Despite the emergence of a number of health insurance programmes and health schemes in India, only 71 percent of households in Chhattisgarh have any kind of health insurance that covers at least one member of the household. Health insurance coverage is differed in rural areas (72%) and urban areas (69%). In Chhattisgarh, three types of

programmes dominate: the *Rashtriya Swasthya Bima Yojana* (RSBY), the State health insurance scheme, and the Central Government Health Scheme (CGHS).

Over two-thirds of women (67%) and 70 percent of men age 15-49 in Chhattisgarh are covered by any health insurance/financing scheme. Older women and men are more likely to be covered than younger women and men. Health insurance/financing scheme coverage is higher among women with no schooling than among those with 12 or more years of schooling.

Tobacco and alcohol use

Over two-fifths (42%) of men, but only 8 percent of women, age 15-49 use some form of tobacco. Tobacco products mostly used by men are *gutkha* or *paan masala* with tobacco (21%), cigarettes (17%), *khaini* (12%), and *paan* with tobacco (4%). Among women and men, the use of any form of tobacco is slightly higher in rural areas (9% for women and 43% for men) than in urban areas (3% for women and 39% for men). Most men (81%) who smoke cigarettes smoked fewer than five cigarettes in the past 24 hours.

In Chhattisgarh, among adults age 15-49, a less proportion (3%) of women and over one-third (36%) of men drink alcohol. Among men, consumption is higher in rural areas than in urban areas (38% versus 30%). Most men who drink alcohol drink it about once a week (50%) or less than once a week (41%), and 9 percent drink almost every day.

HIV/AIDS

This section presents the findings from NFHS-5 on HIV/AIDS knowledge and attitudes, prior HIV testing, and the prevalence of sexually transmitted infections (STIs), as well as sexual behaviour of the adult and youth population. Questions on HIV/AIDS were included only in the subsample of households selected for the state module.

Awareness of HIV or AIDS

Eighty-nine percent of women in Chhattisgarh have heard of HIV or AIDS. In urban areas, 95 percent know about HIV or AIDS, compared with 87 percent in rural areas. Women age 25-29 are more likely (91%) than older women age 40-49 (87%) to have heard of HIV or AIDS. Women with no schooling (78%), women with no regular exposure to media (80%), and scheduled tribe women (81%) are less likely than other women to have heard of HIV or AIDS.

Men are more likely than women to know about HIV or AIDS. Ninety-five percent of men in Chhattisgarh have heard of HIV or AIDS, including 98 percent in urban areas.

Knowledge of prevention and transmission

Men are much more likely than women to know how HIV/AIDS is transmitted and how to keep from getting it. For example, only 76 percent of women know that consistent condom use can help to prevent HIV/AIDS, compared with 85 percent of men, and 77 percent of women know that having just one uninfected partner who has no other partners can reduce the chance of getting HIV/AIDS, compared with 82 percent of men.
Only 23 percent of women and 31 percent of men in Chhattisgarh have a 'comprehensive knowledge' about HIV/AIDS. This means they know that consistent use of condoms every time they have sex and having just one uninfected sex partner who has no other partners can reduce the chance of getting HIV/AIDS, they know that a healthy-looking person can have HIV/AIDS, and they reject two common misconceptions about the transmission or prevention of HIV/AIDS.

Do people know how to prevent HIV/AIDS? *Percentage of women and men age 15-49*

HIV-related stigma

Seventy-nine percent of women and 78 percent of men in Chhattisgarh would be willing to take care of a relative with HIV/AIDS in their home. A similar proportion of women (78%) and men (79%) say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching. Seventy-two percent of women and 75 percent of men say that they would buy fresh vegetables from a shopkeeper with HIV/AIDS. Seventy-four percent of women and 72 percent of men say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret. An almost equal proportion of women (75%) and men (76%) say that an HIV positive student should be allowed to attend school with students who are HIV negative. Over two-thirds of women (72%) and men (64%) think that people living with HIV/AIDS should be treated in the same public hospital as persons who are HIV negative. Over three-quarters (76%) women and men (72%) think that people living with HIV should be allowed to work in the same office with people who are HIV negative.

HIV testing prior to NFHS-5, blood transfusions, and safe injections

Only 13 percent of women and 6 percent of men age 15-49 had ever been tested for HIV prior to NFHS-5. Women and men in urban areas are somewhat more likely to have ever been tested for HIV prior to NFHS-5 than rural women and men. Twenty-one percent of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC. Urban women (26%) are slightly more likely than rural women (20%) to have been tested for HIV during ANC.

Twenty-one percent of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC.

In Chhattisgarh, 6 percent of women and 4 percent of men have ever had a blood transfusion. Women are more likely than men to have received an injection in the past 12 months (63% of women, compared with 51% of men). A disposable syringe was used for injections for 78 percent of adults who received an injection in the past 12 months.

SEXUAL BEHAVIOUR

NFHS-5 included questions on respondents' sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, higher-risk intercourse, and condom use. In addition, men were asked whether they had paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.

Higher-risk behaviour

Higher-risk sex is sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who had sex in the past 12 months, only 1 percent of women and 9 percent of men reported having had higher-risk sex during the past 12 months. The percentage of men who had higher-risk sexual intercourse in the past 12 months is somewhat higher (13%) in urban areas than in rural areas (7%). Even fewer respondents said that they had multiple sex partners in the past 12 months (0.3% of women and 2% of men).

More than half (52%) of men who had higher-risk sex in the past 12 months reported using a condom the last time they had higher-risk sex. Among men who had higher-risk sex in the past 12 months, the proportion who reported using a condom the last time they had higher-risk intercourse is lower in urban areas (49%) than in rural areas (53%). One percent of men said they had paid for sex in the past year.

WOMEN'S EMPOWERMENT

Empowering women and promoting gender equality in every sphere of life are essential to improving their lives and achieving the Sustainable Development Goals. NFHS-5 has collected information related to women's empowerment and autonomy, including menstrual hygiene, employment and earnings, decision-making, ownership of assets, gender role attitudes, and domestic violence.

Women's hygiene

Using a hygienic method of menstrual protection is important for women's health and personal hygiene. In NFHS-5, young women age 15-24 were asked what method or methods they use for menstrual protection, if anything. In Chhattisgarh, 68 percent use cloth, 58 percent use sanitary napkins, 11 percent use locally prepared napkins, and 2 percent use tampons. Overall, 69 percent of women age 15-24 use a hygienic method of menstrual protection, up from 47 percent in NFHS-4. Notably, only 65 percent of rural women use a hygienic method of menstrual protection, compared with 83 percent of urban women.

Employment and earnings

Only 47 percent of all women age 15-49, compared with 84 percent of men, were employed in the 12 months preceding the survey. Among employed women, 83 percent earned cash, including 8 percent who earned both cash and in-kind. Sixteen percent of women were not paid at all. Ninety percent of men who were employed earned cash, including 9 percent who earned both cash and in-kind. Ten percent of employed men were not paid at all. A large majority (91%) of employed women work in non-agricultural occupations, compared with 51 percent of employed men.

Only 47 percent of all women age 15-49 were employed in the 12 months preceding the survey.

Among currently married women who work and are paid in cash, 89 percent decide how their earnings will be used, either alone or jointly with their husbands. Nearly half of women (48%) who work for cash and whose husbands earn in cash say that they earn more than or about the same as their husbands. Eighty-four percent of currently married men who have wives who have cash earnings report that they alone or jointly with their wives decide how her earnings are used, and more than half of men (55%) who have cash earnings and whose wives have cash earnings say that their wife earns more than or about the same as them.

Decision making

Currently married women were asked who makes decisions about their own health care, major household purchases, and visits to their own family or relatives. Women are somewhat more likely to participate in decisions about their own health care and visits to their own family and relatives (88% each) than decision about major household purchases (86%). Overall, 81 percent of currently married women participate in making all three of these decisions, and 7 percent do not participate in making any of the three decisions. Participation in all three decisions varies most by years of schooling, increasing sharply from 75 percent among women with less than 5 years of schooling to 86 percent among women with 12 or more years of schooling.

In the case of currently married men, they are much more likely than women to report that they alone or jointly with their wives participate in making decisions about their own health care (92%) and 95 percent participate in decisions about major household purchases. Overall, 89 percent of currently married men participate in making both these decisions, and only 2 percent of men do not participate in making either of these decisions.

Other indicators of women's empowerment

In Chhattisgarh, 58 percent of women have money that they can decide how to use. The proportion of women who have money that they can decide how to use is higher among urban (63%) than rural (56%) women, increases sharply with age, is much higher among women with no schooling (63%), and is highest among women who are employed for cash (65%) than any other group of women.

Eighty percent of women have a bank or savings account that they themselves use. This percentage is particularly high among women who have 12 or more years of schooling (90%). Women's

knowledge and use of microcredit programmes is very limited. Forty-seven percent of women know of a microcredit programme in their area, but only 6 percent have ever taken a loan from a microcredit programme.

Eighty percent of women have a bank or savings account that they themselves use.

Less than one-quarter (24%) of women who have a mobile phone use it for financial transactions. Urban women are nearly twice (34%) as likely to use a mobile phone for financial transactions, than rural women (18%). This percentage increases with education with over one-third (37%) of women with 12 or more years of education using a mobile phone for financial transactions, compared with over one-tenth of women with no schooling (12%). One-quarter of employed women who earn cash and have a mobile phone use for financial transactions, compared with 16 percent of employed women who don't earn cash and have a mobile phone. Women not belonging to a scheduled caste, a scheduled tribe, or other backward class (34%) are more likely to use a mobile phone for financial transactions than women belonging to any other caste/tribe group.

Ownership of assets

Forty-five percent of women and 72 percent of men age 15-49 in Chhattisgarh own a house alone or jointly with someone else, and 39 percent of women and 66 percent of men own land alone or jointly with someone else. Among men, ownership of a house and land is more common in rural areas than urban areas.

Forty-five percent of women own a house alone or jointly with someone else, and 39 percent of women own land alone or jointly with someone else.

In Chhattisgarh, 41 percent of women have a mobile phone that they themselves use, and among women who have a mobile phone that they themselves use, 80 percent can read SMS messages. Sixty-one percent of urban women have a mobile phone they themselves use, compared with 34 percent of rural women. Mobile phone access increases substantially with education, from 15 percent among women with no schooling to 76 percent among women with 12 or more years of schooling. Only 37 percent of scheduled tribe women have a mobile phone they themselves use, compared with 62 percent of women who belong to any other caste/tribe group. Scheduled tribe women who have a mobile phone that they themselves use are also less likely to be able to read SMS messages (74%) than women who belong to any other caste/tribe group (79-92%).

Forty-one percent of women in Chhattisgarh have a mobile phone that they themselves use.

_ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _

Gender-role attitudes

Twenty-seven percent of women agree that a husband is justified in hitting or beating his wife under some circumstances. Women are most likely to agree that wife beating is justified if a woman shows disrespect for her in-laws (19%), followed by if she argues with him (14%) and she neglects the house or children (13%). Men are more likely to agree: 38 percent say that wife beating is justified in some circumstances, especially if the wife shows disrespect for in-laws (28%) or if she argues with him (23%) or if he suspects her of being unfaithful (19%). Even among women and men who have completed at least 12 years of schooling, nineteen percent of women and 33 percent of men say that a husband is justified in hitting or beating his wife for one or more of the specified reasons.

Eighty-eight percent of women and 67 percent of men believe that a woman is justified in refusing to have sex with her husband if she knows he has a sexually transmitted disease, if she knows he has intercourse with other women, and if she is tired or not in the mood. More than three-quarters of men (76%) agree that if a wife refuses to have sex with her husband he does not have a right to get angry and reprimand her, refuse to give her financial support, use force to have sex even if she doesn't want to, or have sex with another woman.

DOMESTIC VIOLENCE

The World Health Organization recognizes that violence against women, particularly domestic or spousal violence, is a major public and clinical health problem and a violation of women's human rights, which also reflects the scale of gender inequality and discrimination against women. The consequences of violence on physical, mental, sexual, and reproductive health often last a lifetime. NFHS-5 collected information on domestic violence from women age 18-49, related to behaviours of her husband that cause physical, sexual, or emotional harm, including physical violence, sexual coercion, emotional abuse, and controlling behaviours. Information was also collected on violence during pregnancy and help seeking behaviour for any violence experienced.

In Chhattisgarh, 18 percent of women age 18-49 have ever experienced physical violence, and 5 percent have ever experienced sexual violence. In all, 19 percent of women experienced physical or sexual violence and 4 percent experienced both physical and sexual violence. For ever-married women who experienced physical violence since age 15, the most common perpetrator was the current husband.

Over one-fifth (21%) of ever-married women age 18-49 in Chhattisgarh have experienced physical or sexual violence.

32

Violence during pregnancy

One percent of women age 18-49 who have ever been pregnant have ever experienced physical violence during one or more of their pregnancies. Women with different years of schooling except 10-11 years of schooling, women with 5 or more children, women who are widowed, divorced, separated, or deserted, and scheduled tribe or scheduled caste women are more likely to experience violence during pregnancy than women in any other group.

Spousal violence

In Chhattisgarh, 19 percent of ever-married women age 18-49 have experienced any form of physical violence committed by their husband, 5 percent have experienced any form of sexual violence committed by their husband, and 6 percent have experienced any form of emotional violence committed by their husband. Eighteen percent of ever-married women report having been slapped by their husband. Eight percent report being pushed, shaken, or having something thrown at them. Six percent experienced having their arm twisted or hair pulled, 4 percent each being punched with a fist or something that could hurt her and being kicked, dragged, or beaten up, and one percent report that her husband tried to choke or burn her on purpose.

Three percent of ever-married women age 18-49 report that their husbands have physically forced them to have sex even when they did not want to, and 3 percent report that their husband forced them with threats or in any other way to perform sexual acts they did not want to perform. Overall, 20 percent of ever-married women have experienced spousal physical or sexual violence from their current husband or, if not currently married, from their most recent husband. Few ever-married women (3%) reported that they have initiated violence against their husband when he was not already beating or physically hurting them.

Spousal violence prevails across all groups. Although spousal violence is much lower among more educated women, 1 in 9 women who have at least 12 years of schooling have experienced emotional, physical, or sexual spousal violence. The experience of spousal violence is higher among women in rural areas (23%) than in urban areas (15%); and among women who are employed for cash (24%) than women who are not employed (18%). Husband's characteristics are also related to overall spousal violence (emotional, physical, or sexual). For instance, women are more likely to experience spousal violence if their husband gets drunk often (49%), displays 5-6 marital control behaviours (71%), gets drunk sometimes (37%), and if their husband never attended school (29%). More than two-fifths of women (42%) of women who say they are afraid of their husband most of the time have experienced spousal violence. The contextual and intergenerational aspects of spousal violence are clear from the fact that women whose mothers were beaten by their fathers are more than twice as likely to be in abusive marriages themselves as compared with women whose mothers were not beaten by their fathers.

Is alcohol use related to spousal physical or sexual violence?

Percentage of ever-married women experiencing violence

One-fifth of ever-married women age 18-49 who have ever experienced physical or sexual violence reported suffering from injuries from what their husband did to them. That proportion doubles to 45 percent among women who have experienced both physical and sexual violence. The most common types of injuries among ever-married women who have experienced physical and sexual violence are cuts, bruises, or aches (40%); eye injuries, sprains, dislocations, or minor burns (22%); deep wounds, broken bones, broken teeth, or any other serious injury (5%); and severe burns (3%).

Help seeking

Only 8 percent of women age 18-49 who have ever experienced physical or sexual violence sought help, while 10 percent never sought help but told someone. More than four-fifths (82%) never sought help and never told anyone. Among women who sought help, the main sources of help were their own family (61%), their husband's family (30%), or a friend (13%). Only 6 percent sought help from the police.

na = Not applicable

¹ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals. The remaining households are non-nuclear households.

² Protected dug well, protected spring, rainwater, community RO plant, tanker truck, cart with small tank, bottled water

³ Defined as drinking water from an improved source, provided either water is on the premises or round-trip collection time is 30 minutes or less. Includes safely managed drinking water, which is not shown separately.

⁴ Drinking water from an improved source, provided round-trip collection time is more than 30 minutes or is unknown.

⁵ Total may add to more than 100.0 because households may use more than one method of treatment

⁶ Appropriate water treatment methods are boiling, adding bleach/chlorine tablets, filtering, electronic purifying, and solar disinfection

⁷ Includes ventilated improved pit (VIP) latrine/biogas latrine, and twin pit/composting toilet

⁸ Facilities that would be considered improved if they were not shared by two or more households

⁹ Defined as use of improved facilities that are not shared with other households.

¹⁰ Defined as use of improved facilities shared by two or more households.

¹¹ Houses made from mud, thatch, or other low-quality materials are called *kachha* houses, houses that use partly low-quality and partly high-quality materials are called semi-*pucca* houses, and houses made with high quality materials throughout, including the floor, roof, and exterior walls, are called *pucca* houses.

¹² Electricity, LPG/natural gas, biogas

¹³ Includes coal/lignite, charcoal, wood, straw/shrubs/grass, agricultural crop waste, and dung cakes

¹⁴ Frequency of smoking by anyone inside the house

Table 5 Access to a toilet facility

Percentage of households having access to a toilet facility by selected background characteristics, according to residence, Chhattisgarh, 2019-21

Background characteristic	Urban	Rural	Total
Religion of household head			
Hindu	96.2	82.9	85.8
Muslim	98.8	86.5	95.0
Christian	100.0	74.5	81.2

CBR	13.6	17.2	16.4	17.9	21.5	20.7	17.1	24.2	22.7		

Age-specific and total fertility rates and crude birth rates for the 3 years preceding the survey from NFHS-5, NFHS-4, and NFHS-3 by residence, Chhattisgarh

Note: Rates are for the period 1-36 months preceding the survey (approximately 2003-05 for NFHS-3, 2013-2015 for NFHS-4, and 2017-2019 for NFHS-5). Age-specific fertility rates are expressed per woman. Figures in parentheses are based on 125-249 unweighted women-years of exposure.

TFR = Total fertility rate, expressed per woman

CBR = Crude birth rate, expressed per 1,000 population

Table 19 Fertility by background characteristics

Total fertility rate for the 3 years preceding the survey, percentage of women age 15-49 currently pregnant, mean number of children ever born to women age 40-49, and total wanted fertility by background characteristics, Chhattisgarh, 2019-21

		-		
			Mean number

Number of users	9,558	151	461	544	68	795	11,638

Note: All information in this table is based on women's reports. Table includes all users of modern contraceptive methods regardless of their marital status. Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. All modern methods include emergency contraception, which is not shown separately.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device; AYUSH = Ayurveda, yoga and naturopathy, unani, siddha and homeopathy; UHC = Urban health centre; UHP = Urban health post; UFWC = Urban family welfare centre; CHC = Community health centre; PHC = Primary health centre; ANM = Auxiliary nurse midwife; ICDS = Integrated Child Development Services; ASHA = Accredited Social Health Activist; NGO = Nongovernmental organization; TBA = Traditional birth attendant

¹ Excludes standard days method, lactational amenorrhoea method (LAM), and "other" modern methods

Table 32 Informed choice

Among women who are current users of selected modern contraceptive methods who started the last episode of use within the 5 years preceding the survey, percentage who were informed about possible side effects or problems of that method, percentage who were informed about what to do if they experienced side effects, percentage who were ever told by a health or family planning worker about other methods of family planning they could use, and percentage who were informed of all three (Method Information Index) by method, according to residence, Chhattisgarh, 2019-21

Method	Percentage who were informed about side effects or problems of method used	Percentage who were informed about what to do if experienced side effects	Percentage who were informed by a health or family planning worker of other methods that could be used	Percentage who were informed about all three (Method Information Index)	Number of women
		URBAN	N

Total	83.4	77.8	87.5	74.8	2,357

Note: Table includes only the contraceptive methods separately shown in the table and excludes users who obtained their method from friends/relatives or husband.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device

¹ Among women who were sterilized in the 5 years preceding the survey

Table 33 Twelve-month contraceptive discontinuation rates

Among women age 15-49 who started an episode of contraceptive use within the 5 years preceding the survey, percentage of episodes discontinued within 12 months, by reason for discontinuation and specific method, Chhattisgarh, 2019-21

			Reas	on for disco	ntinuation					
	Method	Desire to become	Other fertility related	Side effects/ health	Wanted more effective	Other method related	Othor	A 24	Switched to another	Number of episodes
Method	failure	pregnant	reason ¹	concerns	method	reason ²	Other reason	Any reason ³		of use ⁵
Pill	2.7	17.5	3.9	11.4	7.0	9.2	13.4	65.2	9.6	1,064
IUD or PPIUD	1.0	6.1	1.1	6.0	3.1	4.4	4.4	26.0	6.3	777
Condom/ <i>Nirodh</i>	3.5	19.0	6.4	1.4	5.2	9.9	11.6	57.0	8.8	1,543
Rhythm	2.6	18.9	6.3	0.9	10.2	5.5	11.8	56.2	9.9	1,303
Withdrawal	6.5	20.8	5.3	0.6	11.7	7.7	15.4	68.0	12.6	1,179
Other ⁶	3.2	9.7	3.5	3.9	31.8	8.6	14.7	75.5	32.6	1,923
All modern spacing methods ⁷	2.8	13.7	4.0	5.4	14.8	8.5	12.1	61.3	17.0	5,316
All spacing methods ⁸	3.3	15.6	4.7	4.0	13.3	7.8	12.4	61.1	15.0	7,911
All methods	2.7	12.7	3.8	3.2	10.8	6.4	10.1	49.8	12.2	9,677

Note: Figures are based on life table calculations using information on episodes of contraceptive use that occurred 3-62 months preceding the survey. All methods includes female and male sterilization, and injectables, which are not shown separately.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device

¹ Includes infrequent sex/husband away, difficult to get pregnant/menopausal, and marital dissolution/separation

² Includes lack of access/too far, costs too much, and inconvenient to use

³ Reasons for discontinuation are mutually exclusive and add to the total given in this column

⁴ The episodes of use included in this column are a subset of the discontinued episodes included in the discontinuation rate. A woman is considered to have switched to another method if she used a different method in the month following discontinuation or if she gave "wanted a more effective method" as the reason for discontinuation and started another method within 2 months of discontinuation.

⁵ All episodes of use that occurred within the 5 years preceding the survey are included. Number of episodes of use includes both episodes of use that were discontinued during the period of observation and episodes of use that were not discontinued during the period of observation.

⁶ Includes female condom, diaphragm, foam/jelly, standard days method, lactational amenorrhoea method (LAM), and other modern and traditional methods that are not shown separately.

⁷ Includes pill, IUD/PPIUD, injectables, male condom, female condom, lactational amenorrhoea method (LAM), diaphragm, foam/jelly, and other modern spacing methods that are not shown separately.

⁸ Includes pill, IUD/PPIUD, injectables, male condom, female condom, lactational amenorrhoea method (LAM), diaphragm, foam/jelly, rhythm, withdrawal, and other modern spacing and traditional methods that are not shown separately.

Table 34 Men's contraception-related perceptions and knowledge

Percentage of men age 15-49 who agree with two specific statements about women and contraception, and percent distribution of men according to their belief about the efficacy of condoms in preventing pregnancy, by background characteristics, Chhattisgarh, 2019-21

³ Doctor, auxiliary nurse midwife (ANM), nurse, midwife, lady health visitor (LHV), or other health personnel

Table 58 Male involvement in maternal care: Men's report

Among men age 15-49 whose youngest living child was age 0-35 months, percentage for whom the mother of the child received antenatal care (ANC), percentage who were present for at least one antenatal checkup, percentage who were told by a health provider or worker at any time during the pregnancy about specific signs of pregnancy complications, percentage to whom a health provider or worker spoke about specific aspects of maternal care at any time during the pregnancy, and percentage whose youngest child was delivered in a health facility, and among men with a child age 0-35 months whose youngest living child was not delivered in a health facility, percentage who were given specific home delivery related information, by residence, Chhattisgarh, 2019-21

Antenatal and delivery care information	Urban	Rural	Total
Percentage of men for whom the child's mother received			
antenatal care	95.4	97.0	96.7
Percentage of men who were present at any antenatal			
check-up	81.2	84.4	83.8
Percentage who were told by a health provider or worker about the following signs of pregnancy complications:			
Vaginal bleeding	72.7	69.6	70.2
Convulsions	76.9	71.6	72.6
Prolonged labour	79.4	78.0	78.3
Severe abdominal pain	81.9	79.3	79.8
High blood pressure	71.2	75.7	74.8
Percentage ever told what to do if the child's mother had			
any pregnancy complications	77.4	81.0	80.3
Percentage whose youngest child age 0-35 months was			
delivered in a health facility	95.0	88.0	89.4
Percentage to whom a health provider or worker spoke about the following aspects of maternal care:			
The importance of delivering the baby in a health facility The importance of proper nutrition for the mother	77.3	80.8	80.2
during pregnancy	92.7	87.7	88.7
Family planning or delaying his next child	70.9	74.6	73.9
Number of men with a youngest child age 0-35 months	133	567	700
Among men whose last child age 0-35 months was not delivered in a health facility, percentage who were told the importance of:			
Cord care	*	54.3	56.0
Breastfeeding the baby immediately after delivery	*	73.3	74.8
Keeping the baby warm immediately after birth	*	73.6	70.8
Number of men whose youngest child age 0-35 months			
was not delivered in a health facility	7	68	74
Note: An asterisk indicates that a figure is based on fewer than 25 ur	weighted cases	and has been sup	pressed.

Table 64 Knowledge of ORS packets

Percentage of women age 15-49 who had a live birth in the 5 years preceding the survey who know about ORS packets for treatment of diarrhoea, by background characteristics, Chhattisgarh, 2019-21

		-
Background characteristic	Percentage of women who know about ORS packets	Number of women
Age		
15-19	98.2	75
20-24	97.8	1,715
25-34	98.4	4,077
35-49	96.8	562
Residence		
Urban	99.0	1,365
Rural	97.8	5,065
Schooling		
No schooling	94.5	1,030
<5 years complete	98.8	245
5-9 years complete	98.9	2,535
10-11 years complete	97.7	902
12 or more years complete	99.2	1,717
Religion		
Hindu	98.1	6,225
Muslim	98.3	78
Christian	98.4	93
Other	(100.0)	34
Caste/tribe		
Scheduled caste	98.8	949
Scheduled tribe	96.8	1,999
Other backward class	98.7	3,020
Other	98.4	456
Total	98.1	6,430

Note: Figures in parentheses are based on 25-49 unweighted cases. Total includes women who don't know their caste/ tribe, who are not shown separately.

ORS = Oral rehydration salts

Percentage of children under age 6 years who received any service and received specific services from an anganwadi centre (AWC) in the 12 months preceding the survey, by background characteristics, Chhattisgarh, 2019-21

Forethise who and the set of the set		Perc	Percentage of children age 0-71 months who received from an AWC	of children age 0-71 months eceived from an AWC	s who	,	Children age 36-71 months	.71 months	Children age 0-59 months	n age onths	Children age 0-59 months who were weighed at an AWC	months who at an AWC
immonths	Background characteristic	Any services	Supplementary food ¹	Any immunizations	Health check- ups		Percentage who went for early childhood care/ preschool		Percentage of children who were weighed at an AWC	Number of children	Percentage whose mothers received counselling from an AWC after child was weighed	e I Number of d children

Table is based on children with valid dates of birth (month and year) and valid measurement of both height and weight. Figures in parentheses are based on 25-49 unweighted cases. Total includes information on Note: Table is based on children who stayed in the household the night before the interview. Each of the indices is expressed in standard deviation (SD) units from the median of the WHO Child Growth Standards. children who don't know their birth size & caste/ tribe, who are not shown separately.

BMI = Body mass index

 1 Recumbent length is measured for children under age 2; standing height is measured for all other children

² Includes children who are below -3 standard deviations (SD) from the WHO Child Growth Standards population median

Excludes children whose mothers were not interviewed

⁴ First-born twins (triplets, etc.) are counted as first births because they do not have a previous birth interval

⁵ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.

Excludes children whose mothers were not weighed and measured, children whose mothers were not interviewed, and children whose mothers are pregnant or gave birth within the preceding 2 months. Mother's

nutritional status in terms of BMI (Body Mass Index) is presented in Table 78.

Table 68 Initial breastfeeding

Among last-born children who were born in the 2 years preceding the survey, percentage who were ever breastfed, and percentages who started breastfeeding within 1 hour and 1 day of birth, and among last-born children born in the 2 years preceding the survey who were ever breastfed, percentage who received a prelacteal feed in the first 3 days after birth, by background characteristics, Chhattisgarh, 2019-21

Note: Table is based on last-born children born in the 2 years preceding the survey regardless of whether the children are living or dead at the time of the interview. Figures in parentheses are based on 25-49 unweighted cases. Total includes information on children belonging to other religions, who don't know their caste/ tribe and who were delivered at "other" place, who are not shown separately.

TBA = Traditional birth attendant

¹ Includes children who started breastfeeding within 1 hour of birth

² Children given something other than breast milk during the first 3 days of life

³ Doctor, nurse, midwife, auxiliary nurse midwife, lady health visitor, or other health personnel

Note: Brea	istfeeding status	refers to a "24	4-hour" period	l (vesterdav di	uring the da	wor at night) Childre	an who are	classified as hreas	Note: Breastfeeding status refers to a "24-hour" period (vesterday during the day or at night). Children who are classified as breastfeeding and consuming plain water only consumed po	ning nlain water o	

Note: presured ing status refers to a 24-nout period (period preastfed) of a migrity. Chinaten who are classified as presured ing consuming plain water only consumed no liquid or solid supplements. The categories of not breastfeeding, exclusively breastfeeding and consuming plain water, non-milk liquids, other milk, and complementary foods (solids and semi-solids) are hierarchical and mutually exclusive, and their percentages add to 100 percent. Thus, children who receive breast milk and non-milk liquids and who do not receive other milk and who do not receive complementary foods are classified in the non-milk liquid category even though they may also get plain water. Any children who get complementary food are classified in that category as long as they are breastfeeding as well.

¹ Non-milk liquids include juice, juice drinks, clear broth, and other liquids.

Don't know	а	*	*	1
Total	а	7.2	7.7	4,535

Note: Median and mean durations are based on breastfeeding status of the child at the time of the survey (current status). Includes living and deceased children. Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. Total includes information on children belonging to other religions, who are not shown separately.

a = Omitted because the smoothed percentage is below 50 percent in the first age cell (<2 months) and therefore the median cannot be calculated

¹ For last-born children under age 24 months who live with the mother and are breastfeeding, information to determine exclusive and predominant breastfeeding comes from a 24-hour dietary recall. Tabulations assume that last-born children age 24 months or older who live with the mother and are breastfeeding are neither exclusively nor predominantly breastfed. It is assumed that last-born children not currently living with the mother and all non-last-born children are not currently breastfeeding.

² Either exclusively breastfed or received breast milk and plain water, and/or non-milk liquids only

Table 73 Prevalence of anaemia in children—Continued

Percentage of children age 6-59 months classified as having anaemia, by background characteristics, Chhattisgarh, 2019-21, and total for NFHS-4

	Anaemia	status by haemoglo	obin level	– Any	
Background characteristic	Mild (10.0-10.9 g/dl)	Moderate (7.0-9.9 g/dl)	Severe (<7.0 g/dl)	anaemia (<11.0 g/dl)	Number of children
Child's living arrangements					
Living with both parents	28.7	37.1	1.6	67.4	5,736
Living with one or neither parent	25.0	37.2	1.9	64.0	338
Mother's anaemia status ³					
Not anaemic	29.1	30.6	1.1	60.9	2,302
Mildly anaemic	28.8	36.3	2.0	67.2	1,660
Moderately/severely anaemic	27.6	44.8	1.9	74.3	2,057
Total	28.5	37.1	1.6	67.2	6,074
NFHS-4 (2015-16)	24.0	17.0	0.6	41.6	7,384

Note: Table is based on children who stayed in the household the night before the interview and who were tested for anaemia. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formula (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. Morbidity and Mortality Weekly Report 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). Total includes children whose caste/tribe is unknown, no caste/tribe or missing, who are not shown separately.

¹ Excludes children whose mothers were not interviewed

² For mothers who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.

³ Mildly anaemic is 11.0-11.9 g/dl for non-pregnant women and 10.0-10.9 g/dl for pregnant women. Moderately/severely anaemic is <11.0 g/dl for non-pregnant women and <10.0 g/dl for pregnant women. Adjusted for altitude and for smoking status. Excludes children whose mother's anaemia status is not known.

Note: Table is based on children who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formula (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. *Morbidity and Mortality Weekly Report* 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). The body mass index (BMI) is expressed as the ratio of weight in kilograms to the square of height in metres (kg/m²).

 $^{\rm 1}$ For pregnant women, the value is <11.0 g/dl

² Excludes pregnant women and women with a birth in the preceding 2 months

Note: Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

¹ Comprehensive knowledge means knowing that consistent use of condoms every time they have sex and having just one uninfected faithful sex partner can reduce the chance of getting HIV/AIDS, knowing that a healthy-looking person can have HIV/AIDS, and rejecting two common misconceptions about transmission or prevention of HIV/AIDS

² Sexual intercourse with a partner who was neither a spouse nor lived with the respondent

Table 106 Forms of spousal violence

Percentage of ever-married women age 18-49 who have experienced various forms of violence committed by their husband ever and in the 12 months preceding the survey, Chhattisgarh, 2019-21

		In	the past 12 mor	nths
				Often or
Type of violence	Ever ¹	Often	Sometimes	sometimes
Physical violence				
Any form of physical violence	19.4	2.0	14.6	16.6
Pushed her, shook her, or threw something at her	7.6	0.7	5.7	6.4
Twisted her arm or pulled her hair	6.3	0.9	4.7	5.6
Slapped her	18.0	1.4	13.9	15.3
Punched her with his fist or with something that could hurt her	3.9	0.4	2.9	3.4
Kicked her, dragged her, or beat her up	4.1	0.3	3.3	3.6
Tried to choke her or burn her on purpose	0.8	0.2	0.3	0.6
Threatened her or attacked her with a knife, gun, or any other				
weapon	0.3	0.1	0.1	0.2
Sexual violence				
Any form of sexual violence	5.1	0.6	4.0	4.7
Physically forced her to have sexual intercourse with him even when				
she did not want to	3.4	0.4	2.8	3.2
Physically forced her to perform any sexual acts she did not want to	2.3	0.4	1.8	2.2
Forced her with threats or in any other way to perform sexual acts				
she did not want to	3.4	0.3	2.9	3.2
Emotional violence				
Any form of emotional violence	6.1	1.4	4.1	5.5
Said or did something to humiliate her in front of others	3.9	1.0	2.6	3.5
Threatened to hurt or harm her or someone close to her	3.1	0.5	2.2	2.7
Insulted her or made her feel bad about herself	3.1	0.8	1.9	2.7
Any form of physical and/or sexual violence	20.2	2.2	15.2	17.5
Any form of physical and sexual violence	4.3	0.4	3.4	3.8
Any form of physical and/or sexual and/or emotional violence	21.1	2.7	15.6	18.4
Any form of physical and sexual and emotional violence	2.0	0.3	1.5	1.8
Any violence by women against their husband ²	2.5	0.5	1.9	2.4
Number of ever-married women	2,294	2,294	2,294	2,294

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.

¹ Includes in the past 12 months

² Any violence by women against their husband when he was not already beating or physically hurting her

Table 107 Spousal violence by background characteristics

Never	2.6	11.3	2.2	11.6	12.6	427
Total	6.1	19.4	5.1	20.2	21.1	2,294

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.

¹ Currently married women only

² Behaviours include: Is jealous or angry if she talks to other men, frequently accuses her of being unfaithful, does not permit her to meet her female friends, tries to limit her contact with her family, insists on knowing where she is at all times, and does not trust her with any money

³ Currently married women only. Decisions included are decisions about own health care, major household purchases, and visits to her family or relatives.

⁴ Reasons given for which wife beating is justified include: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn't cook properly, he suspects she is unfaithful, and she shows disrespect for in-laws

⁵ Reasons given for refusing to have sexual intercourse with husband include: she knows her husband has a sexually transmitted disease, she knows her husband has sex with other women, and she is tired or not in the mood

Table 109 Injuries to women due to spousal violence

Percentage of ever-married women age 18-49 who have experienced spousal violence by types of injuries resulting from what their husband did to them, the type of violence, and whether they have experienced the violence ever and in the 12 months preceding the survey, Chhattisgarh, 2019-21

_	Percentage of women who l						
Type of spousal violence experienced	Cuts, bruises, or aches	Severe burns	Eye injuries, sprains, dislocations, or minor burns	Deep wounds, broken bones, broken teeth, or any other serious injury	Any of these injuries	Number of ever-married women

nc = No cases

¹ Women can report more than one source from which they sought help.

APPENDIX

ESTIMATES OF SAMPLING ERRORS

The estimates from a sample survey are affected by two types of errors: (1) non-sampling errors, and (2) sampling errors. Non-sampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the fifth National Family Health Survey (NFHS-5) to minimize this type of error, non-sampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-5 is only one of many samples that could have been selected from the same population, using the same design and expected sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the standard error for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS-5 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-5 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as total fertility rates and child mortality rates.

The Taylor linearization method treats any proportion or mean as a ratio estimate, r = y/x, where *y* represents the total sample value for variable *y*, and *x* represents the total number of cases in the group or subgroup under consideration. The variance of *r* is computed using the formula given below, with the standard error being the square root of the variance:

$$SE^{2}(r) = var(r) = \frac{1-f}{x^{2}} \sum_{h=1}^{H} \left[\frac{m_{h}}{m_{h}-1} \left(\sum_{i=1}^{m_{h}} z_{hi}^{2} - \frac{z_{h}^{2}}{m_{h}} \right) \right]$$

in which

$$z_{hi} = y_{hi} - rx_{hi}$$
, and $z_h = y_h - rx_h$

where h represents the stratum, which varies from 1 to H,

- m_h is the total number of clusters selected in the h^{th} stratum,
- y_{hi} is the sum of the weighted values of variable *y* in the *i*th cluster in the *h*th stratum,
- x_{hi} is the sum of the weighted number of cases in the i^{th} cluster in the h^{th} stratum, and
- *f* is the overall sampling fraction, which is so small that it is ignored.

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers all but one cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the NFHS-5 sample for Chhattisgarh, there were 1,134 clusters. Hence, 1,134 replications were created. The variance of a rate r is calculated as follows:

$$SE^{2}(r) = var(r) = \frac{1}{k(k-1)}\sum_{i=1}^{k} (r_{i} - r)^{2}$$

in which

$$r_i = kr - (k-1)r_{(i)}$$

where r is the estimate computed from the full sample of 1,134 clusters,

- r(i) is the estimate computed from the reduced sample of 1,133 clusters (i^{th} cluster excluded), and
- *k* is the total number of clusters.

In addition to the standard error, the design effect (DEFT) for each estimate is computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. The relative standard error (SE/R) and confidence limits (R±2SE) for each estimate are also computed.

Sampling errors for NFHS-5 are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for Chhattisgarh as a whole and for the urban and rural areas of the state. For each variable, the type of statistic (mean, proportion, rate, or ratio) and the base population are given in Table A.1, Tables A.2-A.4 present the total, urban, and rural values of the statistic (R), their standard errors (SE), the number of unweighted (N) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits (R±2SE) for each variable. The DEFT is considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1).

Table A.1 List of variables for sampling errors, Chhattisgarh, 2019-21

/ariable	Estimato	Base population
/ariable	Estimate	Base population
	HOUSE	HOLDS
Jsing an improved source of drinking water	Proportion	Households
Jsing an improved sanitation facility	Proportion	Households
Jsing iodized salt	Proportion	Households
Sex ratio (females per 1,000 males)	Ratio	De facto household population, all ages
	W	OMEN
No schooling (Females age 6 years and above)	Proportion	De facto household population of females age 6 and above
Jrban residence	Proportion	Women age 15-49
No schooling (Women age 15-49)	Proportion	Women age 15-49
Completed 10 or more years of schooling	Proportion	Women age 15-49
Never married, including married gauna not performed	Proportion	Women age 15-49
Currently married	Proportion	Women age 15-49
Married before age 18	Proportion	Women age 20-49
Currently using any contraceptive method	Proportion	Currently married women age 15-49
Currently using a modern contraceptive method	Proportion	Currently married women age 15-49
Currently using a traditional contraceptive method	Proportion	Currently married women age 15-49
Currently using pill	Proportion	Currently married women age 15-49
Currently using IUD/PPIUD	Proportion	Currently married women age 15-49
Currently using condom/Nirodh	Proportion	Currently married women age 15-49
Currently using female sterilization	Proportion	Currently married women age 15-49
Jsing public health sector source of contraception	Proportion	Women age 15-49 currently using modern methods of contraception
Jnmet need for family planning	Proportion	Currently married women age 15-49
Nant no more children	Proportion	Currently married women age 15-49
Nant to delay next birth at least 2 years	Proportion	Currently married women age 15-49
Mother received four or more antenatal care (ANC) visits	Proportion	Women with at least one birth in last five years (last birth)
Fook iron and folic acid (IFA) for 100 days or more	Proportion	Women with at least one birth in last five years (last birth)
Birth registration	Proportion	De jure children under age 5 years
Births delivered by a skilled provider	Proportion	Births in last 5 years
nstitutional delivery	Proportion	Births in last 5 years
Postnatal check for mother within 2 days of birth	Proportion	Women with at least one birth in last five years (last birth)
Postnatal check for newborn within 2 days of birth	Proportion	Women with at least one birth in last five years (last birth)
Exclusive breastfeeding	Proportion	Children under age 6 months
Children with diarrhoea in the last two weeks	Proportion	Children under age 5 years
Freated with oral rehydration salt (ORS) packets	Proportion	Children under age 5 years with diarrhoea in last 2 weeks
Children with diarrhoea taken to a health provider	Proportion	Children under age 5 years with diarrhoea in last 2 weeks
Child received BCG vaccination	Proportion	Children age 12-23 months
Child received penta or DPT vaccination (3 doses)	Proportion	Children age 12-23 months
Child received polio vaccination (3 doses)	Proportion	Children age 12-23 months
Child received first dose of measles vaccine	Proportion	Children age 12-23 months
Child received penta or hepatitis B vaccination (3 doses)	Proportion	Children age 12-23 months
Child with all basic vaccinations	Proportion	Children age 12-23 months
Height-for-age, stunting (below -2SD)	Proportion	Children under age 5 years who were measured
Weight-for-height, wasting (below -2SD)	Proportion	Children under age 5 years who were measured
Weight-for-age, underweight (below -2SD)	Proportion	Children under age 5 years who were measured
Children with any anaemia	Proportion	Children age 6-59 months with an anaemia test
Nomen with any anaemia	Proportion	Women age 15-49 with an anaemia test
Body mass index (BMI) <18.5 kg/m ²	Proportion	Women age 15-49 who were measured
Body mass index (BMI) ≥25.0 kg/m²	Proportion	Women age 15-49 who were measured
Naist-to-hip ratio ≥0.85	Proportion	Women age 15-49 who were measured
Have heard of HIV or AIDS	Proportion	Women age 15-49
Have comprehensive knowledge about HIV/AIDS	Proportion	Women age 15-49
Ever experienced physical or sexual violence	Proportion	Women age 15-49
Total fertility rate (last 3 years)	Rate	Women
Neonatal mortality	Rate	Births in last 5 years
Postneonatal mortality	Rate	Births in last 5 years
nfant mortality	Rate	Births in last 5 years
Child mortality	Rate	Births in last 5 years
Jnder-five mortality	Rate	Births in last 5 years
	1	MEN .
No schooling (Males age 6 years and above)	Proportion	De facto household population of males age 6 and above
Jrban residence	Proportion	Men age 15-49

No schooling (Males age 6 years and above)	Proportion	De facto household population of males age 6 and above
Urban residence	Proportion	Men age 15-49
No schooling (Men age 15-49)	Proportion	Men age 15-49
Completed 10 or more years of schooling	Proportion	Men age 15-49
Never married, including married gauna not performed	Proportion	Men age 15-49
Currently married	Proportion	Men age 15-49
Married before age 21	Proportion	Men age 25-49
Want no more children	Proportion	Currently married men age 15-49
Want to delay next birth at least 2 years	Proportion	Currently married men age 15-49
Men with any anaemia	Proportion	Men age 15-49 with an anaemia test
Body mass index (BMI) <18.5 kg/m ²	Proportion	Men age 15-49 who were measured
Body mass index (BMI) ≥25.0 kg/m ²	Proportion	Men age 15-49 who were measured
Waist-to-hip ratio ≥0.90	Proportion	Men age 15-49 who were measured
Have heard of HIV or AIDS	Proportion	Men age 15-49
Have comprehensive knowledge about HIV/AIDS	Proportion	Men age 15-49
