

EUROPEAN ANTIBIOTIC AWARENESS DAY

Antibiotic resistance – an increasing threat to human health

infographic

15 Nov 2018

Each year, 33000 people die from an infection due to bacteria resistant to antibiotics. The burden of infections with bacteria resistant to antibiotics on the European population is comparable to that of influenza, tuberculosis and HIV/AIDS combined.

Antibiotic resistance – an increasing threat to human health

Antibiotic resistance is the ability of bacteria to combat the action of one or antibiotics. Humans and animals do not become resistant to antibiotics, but bacteria carried by humans and animals can.

The burden of infections with bacteria resistant to antibiotics on the European population is comparable to that of influenza, tuberculosis and HIV/AIDS combined.

Last-line antibiotics

39% of the burden is caused by infections with bacteria resistant to last-line antibiotics such as carbapenems and colistin - the last treatment option available.

33000 deaths

Each year, 33000 people die from an infection due to bacteria resistant to antibiotics. This is comparable to the total number of passengers of more than 100 medium-sized airplanes.

75% of the burden of bacteria resistant to antibiotics in Europe is due to healthcare-associated infections. This could be minimised through adequate infection prevention and control measures, as well as antibiotic stewardship in healthcare settings.

75 %

healthcare-associated infections

Solutions

There is still time to turn the tide of antibiotic resistance and ensure that antibiotics remain effective in the future by:

Using antibiotics prudently and only when they are necessary.

Implementing good infection prevention and control practices, including hand hygiene as well as screening for carriage of/infection with multidrug-resistant bacteria and isolation of carriers/infected patients.

Promoting research and development of new antibiotics with novel mechanisms of action.

Increasing burden

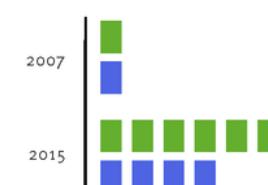

Between 2007 and 2015, the burden of each of the 16 antibiotic-resistant bacteria under study has increased in particular for *Klebsiella pneumoniae* and *Escherichia coli*:

Klebsiella pneumoniae

The number of deaths attributable to infections with *Klebsiella pneumoniae* resistant to carbapenems – a group of last-line antibiotics – increased six-fold.

Escherichia coli

The number of deaths attributable to infections with third-generation cephalosporin-resistant *Escherichia coli* increased four-fold.

Everyone is responsible

Everyone is responsible for addressing this threat to human health: patients, doctors, nurses, pharmacists, veterinarians, farmers, policy makers.

Adapting the infographic (notes for designers)

In case you would like to modify the infographic, please note that you will need to install the Font package (Meta Pro) before opening the Illustrator or InDesign file. Do not open the .ai file without having the fonts installed first.

If you modify the file and install the font, ECDC requires that you de-install the font after finishing the modification since ECDC is not allowed to grant a license for the font.

We would appreciate that graphic elements are not added, with the exception of additional logos. Please do not change colours, spacing, arrangement or font size (if not absolutely necessary). ECDC is happy to double check modifications.

Finally, please state ECDC as the source of this infographic.
