INTRODUCTION

The 2019-21 National Family Health Survey (NFHS-5), the fifth in the NFHS series, provides information on population, health, and nutrition for India and each state and union territory. Like NFHS-4, NFHS-5 also provides district-level estimates for many important indicators. All five rounds of NFHS surveys have been conducted under the stewardship of the Ministry of Health and Family Welfare (MoHFW), Government of India. MoHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-5 was provided by the Government of India. Technical assistance and additional funding for NFHS-5 was provided by the USAID-supported Demographic and Health Surveys Program, ICF, USA. Assistance for some of the Clinical, Anthropometric, and Biochemical (CAB) tests was provided by the ICMR and the National AIDS Research Institute (NARI), Pune.

Four survey questionnaires—household, woman's, man's, and biomarker—were used to collect information in 19 languages using Computer Assisted Personal Interviewing (CAPI). All women age 15-49 and men age 15-54 in the selected sample households were eligible for interviewing. In the household questionnaire, basic information was collected on all usual members of the household and visitors who stayed in the household the previous night, as well as socioeconomic characteristics of the household, water and sanitation, health insurance, and number of deaths in the household in the three years preceding the survey. Two versions of the woman's questionnaire were used in NFHS-5. The first version (district module), which collected information on women's characteristics, marriage, fertility, contraception, reproductive health, children's immunizations, treatment of childhood illnesses, and nutrition was fielded in the entire sample of NFHS-5 households. Information on these topics is available at the district, state, and national levels. In the second version of the questionnaire (state module), four additional topics, namely, sexual behaviour, HIV/AIDS, husband's background and women's work, and domestic violence, were also included. This version was fielded in a subsample of NFHS-5 households designed to provide information only at the state and national levels. The man's questionnaire covered the man's characteristics, marriage, number of children, contraception, fertility preferences, nutrition, sexual behaviour, attitudes towards gender roles, HIV/AIDS, and lifestyle. The biomarker questionnaire covered measurements of height, weight, and haemoglobin levels for children; height, weight, waist and hip circumference, haemoglobin levels, and finger-stick blood for additional CAB testing in a laboratory for women age 15-49 and men age 15-54; and blood pressure and random blood glucose for women and men age 15 years and over. Questionnaire information and biomarkers were collected only with informed consent from the respondents.

The NFHS-5 sample was designed to provide estimates of all key indicators at the national and state levels, as well as estimates for most key indicators at the district level (for all 707 districts in India, as on 31 March, 2017). The total sample size of approximately 610,000 households for India was based on the size needed to produce reliable indicator estimates for each district. The rural sample was selected through a two-stage sample design with villages as the Primary Sampling Units (PSUs) at the first stage (selected with probability proportional to size), followed by a random selection of 22 households in each PSU at the second stage. In urban

areas, there was also a two-stage sample design with Census Enumeration Blocks (CEB) selected at the first stage and a random selection of 22 households in each CEB at the second stage. At the second stage in both urban and rural areas, households were selected after conducting a complete mapping and household listing operation in the selected first-stage units.

Readers should be cautious while interpreting and comparing the trends as some States/UTs may have smaller sample size. Moreover, at the time of survey, *Ayushman Bharat* AB-PMJAY and *Pradhan Mantri Surakshit Matritva Abhiyan* (PMSMA) were not fully rolled out and hence, their coverage may not have been factored in the results of the percentage of households with any usual member covered under a health insurance/financing scheme and the percentage of mothers who received 4 or more antenatal care visits, respectively. Hence, the results should be interpreted with caution.

NFHS-5 fieldwork for Goa was conducted in all 2 districts of the state from 30 August, 2019 to 26 November, 2019 by the Nielsen India Pvt. Ltd. Information was collected from 1,856 households, 2,030 women age 15-49 (including 303 women interviewed in PSUs in the state module), and 313 men age 15-54.

This report presents the key findings of the NFHS-5 survey in Goa, followed by detailed tables and an appendix on sampling errors. At the time of finalization of this report, wealth quintiles for the country as a whole were not ready. Therefore, on finalization of the national report, the breakup of key indicators by wealth quintiles for all states will be provided as an additional document and uploaded on the official website of MoHFW and IIPS.

HOUSEHOLD CHARACTERISTICS

Important household characteristics include household composition, housing characteristics, household possessions, access to a toilet facility, and education. The household characteristics reflect the environmental risk factors and behavioural outcomes of the household population, including their likely impact on health status.

Household composition

In Goa, over two-fifths (41%) of the households are in rural areas. On average, households are comprised of 3.9 members. Twenty-four percent of households are headed by women, with 22 percent of the population living in female-headed households.

Sixty-five percent of households in Goa have household heads who are Hindu. Eight percent of households have household heads who are Muslim and 28 percent of households have household heads who are Christian.

Five percent of households in Goa have household heads who belong to a scheduled caste, 9 percent belong to a scheduled tribe, and 21 percent belong to an other backward class. Sixty-five percent of household heads do not belong to a scheduled caste, a scheduled tribe, or an other backward class. The majority of households (67%) are nuclear, and 43 percent of the population resides in non-nuclear households.

Less than one-fifth (19%) of Goa's population is under age 15; only 9 percent is age 65 and over. The overall sex ratio of the population is 1,027 females per 1,000 males, and the sex ratio of the population under 7 years of age is lower at 774 females per 1,000 males. Ninety-eight percent of persons have an *Aadhaar* card.

Among children below 18 years of age, 4 percent have experienced the death of one or both parents. In all, 88 percent of children below 18 years of age live with both parents, 12 percent live with one parent (mostly with their mother), and the remaining less than 1 percent live with neither parent. Births of all children under 5 years of age were registered with the civil authorities, and 98 percent of children have a birth certificate.

Death registration

All deaths of usual residents of households were registered with the civil authorities.

Disability

The respondent to the Household Questionnaire provided information for all usual household members on whether or not they had any disability in specified domains. The domains of disability are hearing, speech, visual, mental, locomotor, and other. Less than 1 percent (0.7%) of the *de jure* household population has any disability. The most prominent type of disabilities are hearing, speech, and mental (0.2% each). Men are slightly more likely than women to have any disability (0.9% versus 0.5%). A negligible proportion (0.3%) of household members age 0-4 years are reported to have any disability, compared with 1-2 percent of household members in the older age groups.

Housing characteristics

Nine-tenths (90%) of households in Goa live in a pucca house and all households have electricity. Ninety-eight percent of households in Goa have basic drinking water service, and same percentage of households use an improved source of drinking water, but only four-fifths of households have water piped into their dwelling, yard, or plot. Urban households (83%) are more likely than rural households (75%) to have water piped into their dwelling, yard, or plot. Ninety-one percent of households use an appropriate treatment method to make drinking water potable (mostly by boiling). A large majority (97%) of households in Goa use a clean fuel for cooking.

Only four-fifths of households in Goa have water piped into their dwelling, yard, or plot.

Access to toilet facility

Safe sanitation is one of the foundations of a healthy, comfortable, and dignified life. Households without proper sanitation facilities have a greater risk of diseases like diarrhoea, dysentery, and typhoid than households with improved sanitation facilities that are not shared with other households.

In Goa, only 3 percent of all households and 6 percent of rural households do not use an improved sanitation facility; they use open spaces or fields. Ninety-seven percent of households have access to toilet facility, with a much higher accessibility in urban areas (99%) than in rural areas (94%). Access to a toilet facility is high and ranges from 93 percent among scheduled tribe households to 98 percent among households which are not scheduled caste, scheduled tribe, or other backward class households. Access to toilet facility is 96 percent in North Goa (93% in rural areas) and 98 percent in South Goa district (96% in rural areas).

Selected household possessions

In Goa, 69 percent of households own a house (77% of rural households and 63% of urban households). Almost all (99%) households in Goa have a mobile phone. Ninety-seven percent of households have a bank or post office account. Eighty-seven percent of households own either a motorcycle or a scooter. BPL cards are held by 26 percent of households. Irrigated land is owned by 4 percent of rural households and 3 percent of urban households. Overall, 10 percent of all households in Goa own agricultural land, and only six percent of households own farm animals.

Background characteristics of respondents

Twenty-seven percent of women and 31 percent of men are in the 15-24 age group, while 27 and 32 percent of women and men, respectively, are in the 25-34 age group. Forty-one percent of women and 37 percent of men are in rural areas.

In NFHS-5, literate persons are those who have either completed at least standard 9 or passed a simple literacy test conducted as part of the survey. According to this measure, 92 percent of women age 15-49 and 94 percent of men age 15-49 are literate.

Six percent of women and 3 percent of men age 15-49 have never been to school. However, only 48 percent of women age 15-49 in Goa have completed 12 or more years of schooling, compared with 54 percent of men.

Media exposure is quite widespread among women and men in Goa. Ninety-four percent of men and 85 percent of women watch television at least once a week. However, men (59%) are more likely than women (47%) to read a newspaper or magazine at least once a week. Two percent of men and 8 percent of women are not regularly exposed to print media or other forms of media.

Women are more likely than men to be currently married (63% versus 49%), while men are more likely than women to be never married (51% versus 33%). Three percent of women are widowed. A majority of female respondents are Hindus (66%), while 25 percent are Christians, and 9 percent are Muslims.

Twenty-two percent of female respondents belong to an other backward class, while 6 percent belong to a scheduled caste. Ten percent of women and 16 percent of men belong to a scheduled tribe, while 56 percent of men and 62 percent of women age 15-49 do not belong to a scheduled caste, a scheduled tribe, or an other backward class.

Sixty-seven percent of women and 22 percent of men age 15-49 were not employed in the 12 months preceding the survey. Seven percent of women and 4 percent of men were engaged in an agricultural occupation, while one-quarter of women and almost three-quarters (72%) of men were employed in a non-agricultural occupation.

EDUCATION

In NFHS-5, information related to preschool attendance has been collected for the first time, in addition to school attendance among children age 6-17 years and educational attainment of other members of the household, including reasons for drop-out in the case of those who discontinued education.

Preschool attendance

In India many children attend *anganwadi* centres that provide spaces for children to learn, play, eat nutritious food, and develop the skills needed for a lifetime of learning. Attending pre-primary education, such as at an *anganwadi* centre, improves children's school readiness by it providing quality learning through interactive, play methods with qualified instructors. Also, parents or guardians can go to work at ease if children are enrolled in pre-primary education.

In Goa, 52 percent of boys and 59 percent of girls age 2-4 years attend preschool. Preschool attendance is lower among children in non-nuclear households (53%) than children in nuclear households (57%). Preschool attendance is a little higher among children in households headed by Hindus (56%) than Christians (54%). Preschool attendance among children not belonging to a scheduled caste, scheduled tribe or other backward class is 53 percent. Preschool attendance is the same in households with 6 or more members and 3-5 members (55%). Overall, urban households (55%) show slightly higher preschool attendance than rural households (54%). Pre-

school attendance is much higher among children in North Goa district (64%) than in South Goa district (42%).

School attendance among children

Ninety-six percent of children age 6-17 years in Goa attend school and there is no variation in urban areas and rural areas. School attendance is almost universal (99%) at age 6-14 years, but drops sharply to 88 percent at age 15-17 years. There is no gender disparity in school attendance in the 6-14 year age group; however, in the age group 15-17 years, boys are more likely than girls to attend (91 percent of boys compared with 85 percent of girls).

Are there gender differentials in children's school attendance?

Percentage of children attending school by age

FERTILITY

This section provides trends in the total fertility rate, age at marriage, pregnancy outcomes, teenage pregnancy, birth interval, the desire for more children, and son preference. NFHS-5 estimates on the median age at marriage, total fertility rate, and teenage motherhood illustrated in this section can help in setting benchmarks for the Sustainable Development Goals at the sub-national level.

Age at first marriage

In Goa, the median age at first marriage is 25.7 years among women age 30-34 years and 25.4 years among women age 35-39 years and 45-49 years. Only 23 percent of women age 20-49 years have never married, compared with 44 percent of men age 20-49. Only six percent of women age 20-24 years got married before attaining the legal minimum age of 18 years, down from 10 percent in NFHS-4. Seventy-eight percent of women age 20-24 years are never married, compared with 98 percent of men in the same age group, showing that the age at marriage is much lower for women than men in Goa.

Fertility levels

The total fertility rate (TFR) in Goa is 1.3 children per woman, which is well below the replacement level of fertility. Fertility has decreased by 0.4 children between NFHS-4 and NFHS-5.

The total fertility rate in urban areas, at 1.3 children per woman, and in rural areas, at 1.4 children per woman, are both much below the replacement level. Among births in the three years preceding the survey, 2 percent were of birth order four or higher, compared with 4 percent in NFHS-4.

Fertility Trends

Total fertility rate
(children per woman)

The greatest differentials in fertility are by religion, and caste/tribe. At current fertility rates, Muslim women will have an average of 0.3 children less than Hindu women (a TFR of 1.2, compared with 1.5) and 0.2 children more than Christian women (a TFR of 1.0).

How does fertility vary with schooling?

Total fertility rate (children per woman)

Pregnancy outcome

Eighty-five percent of last pregnancies in the five years preceding the survey ended in a live birth, and the remaining 15 percent terminated in foetal wastage (abortion, miscarriage, or stillbirth). Miscarriage is the most commonly reported type of foetal wastage, accounting for 11 percent of all pregnancies, and abortions accounted for 5 percent.

Teenage pregnancy

Among young women age 15-19 in Goa, 3 percent have already begun childbearing, that is, they have already had a live birth or are pregnant with their first child, which is the same as in NFHS-4. The proportion of women who have started childbearing rises sharply from 2 percent at age 18 years to 8 percent among women age 19 years. The proportion who have started childbearing is much higher among young women who had 5-9 years of schooling (6%) than those with more number of years of schooling (2% and 1% among 10-11 and 12 or more years of schooling, respectively).

Birth intervals

The median interval between births in the five years before the survey in Goa is 43.3 months. Eight percent of births take place within 18 months of the previous birth and 19 percent occur within 24 months. Less than two-fifths (39%) of all births occur within three years of the previous birth. Research shows that waiting at least three years between children reduces the risk of infant mortality and has a positive impact on maternal health.

Less than two-fifths (39%) of births in Goa occur within three years of the previous birth.

Fertility preferences

Sixty-one percent of currently married women and 55 percent of men age 15-49 years want no more children, are already sterilized or have a spouse who is sterilized. Among those who want another child, 39 percent of women and 32 percent of men would like to wait at least two years before the next birth. Eighty-nine percent of women and 95 percent of men consider the ideal family size to be two or fewer children.

In Goa, there is a strong preference for sons. Six percent of women and 3 percent of men want more sons than daughters, but only 3-4 percent of men and women want more daughters than sons. However, equally about three-fifths (61%) of women would like to have at least one son and at least one daughter while a little over four-fifths (81%) of men would like to have at least one son and at least one daughter.

Women's desire for more children is strongly affected by their current number of sons. For example, among women with two children, 82 percent with 2 sons want no more children, compared with 73 percent with two daughters who want no more children. Notably, the proportion of currently married women with two children who want no more children irrespective of their number of sons have remained almost unchanged (at about 85%) in the 4 years since NFHS-4 while this percentage for currently married men has decreased by 15 percentage points since NFHS-4.

How does son preference affect women's desire for children?

Percentage of currently married women with two children who want no more children

In Goa, unplanned pregnancies are fairly common. If all women were to have only the number of children they wanted, the total fertility rate would have been 1.2 children per woman, instead of the current level of 1.3 children per woman.

FAMILY PLANNING

The family planning section covers trends in contraceptive knowledge and current use, informed choice, and unmet need for family planning methods among women age 15-49 years. It also includes information on men's attitude towards women using a contraceptive method. As in previous rounds of the survey, NFHS-5 provides estimates of the contraceptive prevalence rate and unmet need for family planning.

Contraceptive knowledge and use

Knowledge of contraception is universal in Goa. However, some methods are still less well known. Only 45 percent of currently married women know about female condoms. Among all women, 71 percent know about emergency contraception.

The contraceptive prevalence rate (CPR) among currently married women age 15-49 is 68 percent, substantial increase from NFHS-4 (26%). The use of modern family planning methods (60%) has also increased substantially from its level in NFHS-4 (25%). The use of female sterilization has increased, from 16 percent to 30 percent between NFHS-4 and NFHS-5; the share of female sterilization in overall contraceptive use has increased from 44 percent to 66 percent in the four years between NFHS-4 and NFHS-5.

How many women use family planning?

Percentage of currently married women

Contraceptive use in NFHS-5 increases sharply with age, from 58 percent for women age 20-24 to 71 percent for women age 30-39 and then decreases to 69 percent for women age 40-49.

In Goa, contraceptive use is much higher (72%) in urban areas, than rural areas (61%). Sixty-six percent of currently married women with no schooling use female sterilization, compared with only 17 percent of women with 12 or more years of schooling. Christian women (58%) are less likely to use contraception than either Hindu (70%) women or Muslim women (77%).

Women in Goa are much more likely to use contraception if they already have a son. For example, among women with two children, 77 percent with at least one son use a method of family planning, compared with 66 percent of women with two daughters and no sons.

What contraceptive methods do women use?

Currently married women

The most common modern spacing methods used by currently married women in Goa are condom/ *Nirodh* (23%), followed by the pill (3%) and IUD or PPIUD (2%). In general, urban women and better-educated women are more likely than other women to use spacing methods.

Eighty-one percent of sterilized women had their sterilization operation in the public sector, mainly in a government or municipal hospital and the majority of condom/ *Nirodh* (59%) users get their supply from the private health sector or other source, including a shop. Nonetheless, almost one-quarter (23%) of users of condom/ *Nirodh* get their supply from the public sector.

The 12-month discontinuation rate for any reason is 55 percent for all contraceptive methods. Almost three-fifths (59%) of users of modern spacing methods discontinued use within the first year after they adopted the method. The common reasons for discontinuation are other fertility related reason, side effects/health concerns, and desire to become pregnant.

Almost three-fifths (59%) of users of modern spacing methods discontinued use within the first year after they adopted the method.

Informed choice

Women who know about all available contraceptive methods and their side effects can make better choices about what method to use. A large majority (91%) of users of selected modern contraceptive methods were ever told by a health or family planning worker about other methods they could use, 85 percent were told about the possible side effects or problems with their method, and fewer (69%) were told what to do if they experienced any side effects.

Men's attitudes

Only 1 percent men age 15-49 in Goa agree that contraception is women's business and a man should not have to worry about it and even less than 1 percent (0.3%) of men think that women using contraception may become promiscuous. Four-fifths of men know that a condom, if used correctly, protects against pregnancy most of the time.

Unmet need

Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop childbearing entirely, but are not using contraception. According to this definition, 8 percent of currently married women have an unmet need for family planning, a substantial decline since NFHS-4 (18%). Currently, 89 percent of the demand for family planning is being satisfied and 79 percent of the demand is being satisfied by modern methods.

Contraceptive Prevalence Rate by District

Percentage of currently married women

INFANT AND CHILD MORTALITY

The mortality rate among children under age 5 years including neonatal, postneonatal and infant mortality rates is an important indicator that measures the overall wellbeing of a country. The infant mortality rate in Goa in NFHS-5 is estimated at 6 deaths before the age of one year per 1,000 live births, down from the NFHS-4 estimate of 13, the NFHS-3 estimate of 15, the NFHS-2 estimate of 37, and the NFHS-1 estimate of 32.

Trends in Infant Mortality

Deaths per 1,000 live births

MATERNAL HEALTH

Maternal health is an important aspect for the development of any country in terms of increasing equity and reducing poverty. The survival and well-being of mothers is not only important in their own right, but is also central to solving broader economic, social, and developmental challenges. Maternal health care services are essential for the health and wellbeing of mothers, as well as their children, affecting the overall population and its health and nutritional status. This section describes the utilization of antenatal care, delivery care, and postnatal care by women who reported their last births in the five years preceding the survey. It also shows the extent of male involvement in maternal health care.

Antenatal care

Among mothers who gave birth in the five years preceding the survey, almost all (99%) received antenatal care for their last birth from a health professional (98% from a doctor and 1% from an auxiliary nurse midwife (ANM), lady health visitor (LHV), nurse, or midwife). One percent did not receive any antenatal care (ANC). Among mothers who gave birth in the five years preceding the survey, 98 percent registered the pregnancy for the most recent live birth. Among the registered pregnancies, all received a Mother and Child Protection Card (MCP Card).

Four or More Antenatal Care Visits by District

Percentage of last births in the past five years

Majority (70%) of women received antenatal care during the first trimester of pregnancy, as is recommended. Rural women (76%) are more likely to receive antenatal care during the first trimester of pregnancy than the urban women (67%). Ninety-three percent of mothers had four or more antenatal care visits.

Since NFHS-4, there has been an increase in the percentage of mothers who had four or more antenatal care visits (from 89% to 93%) and a huge drop in the proportion of women who had an antenatal check in the first trimester (from 84% to 70%). For almost all (99%) of their last births, mothers received iron and folic acid (IFA) supplements, but only 88 percent consumed them for the recommended 100 days or more and only 65 percent consumed them for the newly recommended 180 days or more. Ninety-seven percent of last births were protected against neonatal tetanus through tetanus toxoid vaccinations given to the mother. Thirty-five percent of mothers took an intestinal parasite drug during pregnancy.

Ninety-three percent of mothers in Goa had at least four antenatal care visits for their last birth.

Among women with a live birth in the five years preceding the survey who met with a community health worker in the last three months of pregnancy for their most recent live birth, at least 95 percent received advice on each of five different areas (all received advice on breastfeeding and cord care, 97% on the importance of institutional delivery, 96% on keeping the baby warm, and 95% on family planning).

How does appropriate antenatal care (ANC) vary with schooling?

Percentage of last births in the past five years

Note: Categories 'No schooling' and '<5 years complete' not shown since there are fewer than 25 unweighted cases.

In Goa, almost all women who received antenatal care for their last birth received each of the services needed to monitor their pregnancy: having their weight taken, their blood pressure measured, having a urine sample taken, having a blood sample taken, and having their abdomen examined.

An ultrasound test was performed during 96 percent of pregnancies in the five years preceding the survey. Urban women were more likely to have an ultrasound test than rural women.

Delivery care

All the births take place in a health facility (mostly in a government facility).

Forty percent of births during the past 4 years were delivered by caesarean section. Almost half (49%) of caesarean sections (19% of all births) were emergency caesarean sections.

Among women who had a live birth in the five years preceding the survey that was delivered in a health facility, only 7 percent received financial assistance under *Janani Suraksha Yojana* (JSY).

Are babies being delivered safely?

Percentage of births in the past five years

All children in Goa who were born in the past five years were born in a health facility.

Postnatal care

Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. In Goa, 97 percent of mothers had a postnatal check after their last birth and 95 percent of mothers had a postnatal check within two days of the birth, as is recommended.

Almost all (97%) of last births in the five years preceding the survey received a health check in the first two days after birth.

CHILD HEALTH

Vaccination of children

Vaccinations are considered as the most cost-effective intervention that can improve the overall health of children. Eighty-two percent of children age 12-23 months received all basic vaccinations against six major childhood illnesses (tuberculosis, diphtheria, pertussis, tetanus, polio, and measles) at any time before the survey. However, 98 percent of children are at least partially vaccinated; only 2 percent have not received any vaccinations at all. Vaccinations were recorded from a vaccination card for a large majority (88%) of children, which is a marginal drop since NFHS-4 (90%).

Ninety-eight percent of children have received a BCG vaccination. However, 88 percent of children have received the recommended three doses of polio vaccine, 91 percent have received the three recommended doses of DPT or Penta vaccine, and 93 percent have been vaccinated against measles. There is considerable dropout between the first and third doses of DPT vaccine (from 98% to 91%) and polio vaccine (from 98% to 88%). It should be noted that the Penta vaccine was not widely available at the time of the NFHS-4 survey.

Trends in Vaccination Coverage

Percentage of children 12-23 months receiving vaccinations

Between NFHS-4 and NFHS-5, there was an increase in vaccination coverage for three doses of hepatitis B (from 85% to 93%) and slight decline for three doses of DPT (from 94% to 91%), three doses of polio (from 93% to 88%) measles (from 97% to 93%), and BCG (from 100% to 98%). In addition, 97 percent of children have received at least one dose of hepatitis B vaccine, and 93 percent of children have received all three recommended doses of hepatitis B vaccine.

Childhood illnesses

In the two weeks before the survey, 1 percent of children under age five years had symptoms of an acute respiratory infection (cough accompanied by (1) short, rapid breathing that is chest related and/or (2) difficult breathing that is chest related).

Eighteen percent of children under age five were reported to have had fever in the two weeks preceding the survey; 87 percent of these children were taken to a health facility or provider for treatment.

Overall, 3 percent of children under age five years had diarrhoea in the two weeks preceding the survey. Almost all (99%) of mothers of young children have heard of oral rehydration salt (ORS) packets for the treatment of diarrhoea.

Integrated Child Development Services (ICDS)

The ICDS programme provides nutrition and health services for children under age six years and pregnant or breastfeeding women, as well as preschool activities for children age 3-5 years. These services are provided through community-based *anganwadi* centres.

How many children received *anganwadi* centre services?

Percentage of age-eligible children receiving services

Seventy percent of children under 6 years received services of some kind from an *anganwadi* centre in the 12 months preceding the survey. The most common services that age-eligible children receive are supplementary food and growth monitoring (66% each), health check-ups (58%), and early childhood care or preschool (45%). The service that is least likely to be accessed is immunizations (40%). Two-thirds of mothers of children who were weighed at an *anganwadi* centre received counselling from an *anganwadi* worker or an ANM. Among children under age 6 years, at least 9 in 10 of their mothers received any service from an *anganwadi* centre during pregnancy (90%), and while breastfeeding (89%).

BREASTFEEDING, NUTRITION, AND ANAEMIA

Infant feeding

Ninety-three percent of children born in the 2 years before the survey are put to the breast within the first day of life, but only 62 percent started breastfeeding in the first hour of life (as recommended). While exclusive breastfeeding indicators show an improvement since NFHS-4, many infants are still deprived of the highly nutritious first milk (colostrum) and the antibodies it contains.

It is recommended that nothing be given to children other than breastmilk even in the first three days when the milk has not begun to flow regularly because prelacteal feeds limit the frequency of suckling by the infant and expose the baby to the risk of infection. However, 10 percent of children are given something other than breastmilk during the first three days.

WHO has several recommendations for infant and young child feeding (IYCF) practices for children age 6-23 months. The key IYCF indicators measure the adequacy of dietary diversity and meal frequency for breastfed and non-breastfed children. Only 45 percent each of children age 6-23 months are fed the recommended minimum number of times per day and the appropriate number of food groups. Less than one-quarter (22%) are fed according to all three recommended practices.

Micronutrient deficiency is a major contributor to childhood morbidity and mortality. Vitamin A is an essential nutrient for the immune system. Severe vitamin A deficiency (VAD) can cause eye damage and a higher risk of dying from measles and diarrhoeal disease. The Government of India recommends that children under 5 years of age receive vitamin A supplements every six months, starting at age 9 months. In Goa, 92 percent of children age 9-35 months were given a vitamin A supplement in the past six months, but only 55 percent of children age 6-23 months ate vitamin A-rich foods during the day or night before the survey.

Iron deficiency is a primary cause of anaemia. Eating foods rich in iron and taking iron supplements can help prevent anaemia. Thirty-two percent of children age 6-23 months ate iron-rich foods during the day or night before the survey; however, over half of children (53%) in the same age group were given iron supplements in the week before the survey.

Children's nutritional status

Childhood undernutrition contributes to childhood diseases and is a major cause of child mortality in India. Twenty-six percent of children under age five years are stunted, or too short for their age, which indicates that they have been undernourished for some time. Nineteen percent are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness causing weight loss, and 8 percent are severely wasted. Slightly less than one-quarter (24%) of children are underweight, which takes into account both chronic and acute undernutrition.

The percentage of children who are stunted increased from 20 percent to 26 percent while percentage of children who are underweight remained almost unchanged in the 4 years between NFHS-4 and NFHS-5. In the same period, the percentage of children who are wasted declined from 22 percent to 19 percent. However, the continuing high levels of undernutrition are still a major problem in Goa.

Trends in Children's Nutritional Status

Percentage of children under five years

Note: Nutritional status estimates are based on the 2006 WHO International Reference Population

Differences in the levels of malnutrition are more pronounced for several background characteristics. The level of undernutrition is relatively high for rural children than urban children and among male children than female children on all three nutritional status measures.

Adults' nutritional status

Malnutrition refers to deficiencies, excesses, or imbalances in a person's intake of energy and/or nutrients, and includes undernutrition as well as overweight and obesity. The body mass index (BMI), which is defined as a person's weight in kilograms divided by the square of the person's height in metres, is a measure that indicates the nutritional status in adults.

In Goa, 50 percent of women and 45 percent of men are either too thin or overweight or obese. Among women age 15-49, the proportion overweight or obese is 36 percent, marginal increase since NFHS-4. More men are overweight or obese (33%) than thin (13%), which is similar to the pattern observed in NFHS-4. Fourteen percent of women in Goa are too thin. Half of women and more than half of men (55%) are at a healthy weight for their height.

Undernutrition is particularly common in the younger age groups (especially age 15-19), in rural areas, and among scheduled caste women and scheduled tribe women. Overweight or obesity is most prevalent in older adults, and urban women.

For the first time, the 2019-21 NFHS measured the waist circumference and hip circumference of women and men age 15-49 years. This information was used to calculate the waist-to-hip ratio (WHR). WHR helps to identify the distribution of body fat and predicts abdominal obesity. Abdominal obesity is associated with an increased risk of type 2 diabetes mellitus, myocardial infarction, stroke, and premature death.

A little over half (51%) of women and 35 percent of men have a waist-to-hip ratio (WHR) that puts them at a substantially increased risk of metabolic complications. The proportion of adults with an increased risk WHR increases with age, from 36 percent for women age 15-19 to 61 percent for women age 40-49, and from 23 percent for men age 20-29 to 57 percent for men age 40-49. The proportion of women having a substantially increased risk WHR is the same (51% each) in urban areas and rural areas and among men it is only somewhat higher in rural areas (38%) than in urban areas (34%).

How many women are at a healthy weight for their height?

Percent distribution of women

The use of iodized salt prevents iodine deficiency, which can lead to miscarriage, goitre, and mental retardation. Ninety-eight percent of households with tested salt were using iodized salt at the time of the survey.

Anaemia

Anaemia is a condition that is marked by low levels of haemoglobin in the blood. Iron deficiency is estimated to be responsible for about half of all anaemia globally, but anaemia can also be caused by malaria, hookworms and other helminths, other nutritional deficiencies, chronic infections, and genetic conditions. Anaemia can result in maternal mortality, weakness, diminished physical and mental capacity, increased morbidity from infectious diseases, perinatal mortality, premature delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement. Anaemia is a major health problem in Goa, especially among women and children.

More than half (53%) of children age 6-59 months are anaemic. This includes 26 percent who are mildly anaemic, 25 percent who are moderately anaemic, and 2 percent who have severe anaemia. The overall prevalence of anaemia in children increased from 48 percent in NFHS-4 to 53 percent in NFHS-5. The prevalence of anaemia among girls is higher (59%) than boys (48%) in NFHS-5. Children of mothers who have anaemia are much more likely to be anaemic. Although anaemia levels vary somewhat according to background characteristics, anaemia among children is widespread in every group. Half of children in Goa are anaemic even if their mother has 12 or more years of schooling.

Anaemia among women, men, and children

Thirty-nine percent of women in Goa have anaemia, including 23 percent with mild anaemia, 15 percent with moderate anaemia, and 1 percent with severe anaemia. Anaemia is particularly high among urban women, women age 15-19, women with less than 10 years of schooling, Muslim women, and scheduled caste women, but anaemia exceeds 32 percent for every group of women. Anaemia among women has increased by 8 percentage points since NFHS-4. Over one-tenth (13%) of men in Goa are anaemic. Men age 30-39 and in urban areas are particularly likely to be anaemic.

ADULT HEALTH AND HEALTH CARE

Tuberculosis

Tuberculosis is an infectious disease caused by a type of bacterium called *Mycobacterium tuberculosis*, which primarily affects the lungs. Tuberculosis is transmitted from person to person through the air, and people with lowered immunity, HIV, malnutrition, diabetes, and those who use tobacco or alcohol have higher chances of getting tuberculosis. Tuberculosis is both preventable and curable, however mortality is high if not treated properly. In Goa, 329 persons per 100,000 are estimated to have medically treated tuberculosis, based on reports from household respondents. The prevalence of medically treated tuberculosis is lower among women (259) than among men (400) and is higher in rural areas (353) than in urban areas (312).

Almost all (98% each) of women and men have heard of tuberculosis, but even among those who have heard of tuberculosis, 94 percent of women and 91 percent of men know that it is spread through the air by coughing or sneezing. One-quarter of women and almost one-fifth (19%) of men have misconceptions about how tuberculosis is spread. Overall, 96 percent of women and 94 percent of men know that tuberculosis can be cured, and only 3 percent of women and almost half (49%) of men say that if a family member had tuberculosis, they would want to keep it a secret.

Diabetes, asthma, goitre, heart disease, and cancer

According to self-reports, 4,139 women and 1,648 men age 15-49 per 100,000 have diabetes. Overall, 389 women and 315 men per 100,000 have asthma. Asthma is considerably higher in urban areas than rural areas. Goitre is more common than asthma among women (2,548 women per 100,000). The prevalence of any heart disease is higher among women (426 per 100,000) than among men. Among the five diseases, cancer is the least common, with 193 women per 100,000 reportedly having cancer.

Blood pressure (hypertension)

Blood pressure is the force exerted by circulating blood against the arterial walls. Hypertension or high blood pressure is a condition in which the blood vessels have persistently raised pressure. Hypertension is a major risk factor for cardiovascular diseases, chronic kidney diseases, and brain diseases, and it is a major cause of premature deaths worldwide. Some of the risk factors for developing hypertension are unhealthy diets, physical inactivity, alcohol and tobacco consumption, and excess body weight.

Thirteen percent of women age 15-49 in Goa have hypertension, including 7 percent with Stage 1 hypertension and 1 percent with Stage 2 and less than 1 percent (0.3%) with Stage 3 hypertension. Hypertension also includes women with normal blood pressure who are taking medicine to lower their blood pressure. Fifty-eight percent of women have normal blood pressure.

The prevalence of hypertension among men age 15-49 is somewhat higher than among women. Eighteen percent of men in Goa have hypertension, including 14 percent with Stage 1 hypertension, 2 percent with Stage 2 hypertension, and 1 percent with Stage 3 hypertension. Hypertension also includes men with normal blood pressure who are taking medicine to lower their blood pressure. Thirty-seven percent of men have normal blood pressure. For both women and men, hypertension increases with age.

Blood glucose

Diabetes mellitus is a chronic metabolic disease characterized by elevated levels of blood glucose. Diabetes over a period of time can cause severe damage to the heart, blood vessels, retina, kidneys, and nerves, and it puts sufferers at increased risk of various infectious and non-infectious diseases. Early diagnosis, determined by blood glucose testing, and adequate treatment are the key steps for managing diabetes and its complication. NFHS-5 has included random blood glucose measurement using capillary blood among women and men age 15 and above.

In Goa, six percent of women age 15-49 have high blood glucose levels, and 5 percent have very high blood glucose levels. In comparison, 6 percent of men age 15-49 have high and 9 percent have very high blood glucose levels. Women and men in older age groups have relatively high blood glucose levels.

Men are more likely than women to have normal blood glucose levels and are taking medicine to lower their blood glucose level (3% of men versus 0.7% of women). Eleven percent of women and 18 percent of men have blood glucose levels ≥ 140 mg/dl and are taking medicine to lower their blood glucose level.

Screening tests for cancer

Cancer is a group of diseases with high mortality, and it is the second leading cause of death globally. The chances of successful treatment of cancer increase if diagnosed early. One way of early detection is screening, which is the identification of unrecognized disease by using simple tests or examinations among those individuals who have the disease but do not yet have symptoms. NFHS-5 collected information about whether respondents had ever undergone screening test for cancer of the oral cavity, breast, and cervix.

In Goa, only 1 percent each of women age 15-49 have ever undergone a screening test for cancer of the cervix, breast cancer, and oral cavity. Men are slightly more (2%) likely than women to have ever undergone a screening test for cancer of the oral cavity.

Health insurance

Universal access to health care is the absence of any barriers in health care, including economic barriers. Adequate coverage by health insurance protects a person from financial hardships because of the costs of health care. Despite the emergence of a number of health insurance/financing schemes in India, only 66 percent of households in Goa have any kind of health insurance/financing scheme that covers at least one member of the household. Health insurance/financing scheme coverage is higher in rural areas (68%) than urban areas (65%). In Goa, three types of programmes dominate: the State health insurance scheme, the Employees' State Insurance Scheme (ESIS), and the Central Government Health Scheme (CGHS).

Over two-thirds (68%) of women and about three-quarters (73%) of men age 15-49 in Goa are covered by any health insurance/financing scheme. Health insurance/financing scheme coverage is much higher among men and women in rural areas than urban areas.

Tobacco and alcohol use

One-quarter of men, but only 1 percent of women, age 15-49 use some form of tobacco. Tobacco products mostly used by men are cigarettes (13%), and *gutkha* or *paan masala* with tobacco (12%). Among men, the use of any form of tobacco is slightly higher in urban areas (28%) than in rural areas (19%).

In Goa, among adults age 15-49, 59 percent of men and less than 5 percent of women drink alcohol. Sixty-one (61%) percent of men drink alcohol in rural areas which is higher than in urban areas (58%). Most men who drink alcohol drink it less than once a week (45%) and about once a week (35%).

HIV/AIDS

This section presents the findings from NFHS-5 on HIV/AIDS knowledge and attitudes, prior HIV testing, and the prevalence of sexually transmitted infections (STIs), as well as sexual behaviour of the adult and youth population. Questions on HIV/AIDS were included only in the subsample of households selected for the state module.

Awareness of HIV or AIDS

All men and almost all (99%) women in Goa have heard of HIV or AIDS.

Knowledge of prevention and transmission

Men are much more likely than women to know how HIV/AIDS is transmitted and how to keep from getting it. For example, 90 percent of women know that consistent condom use can help to prevent HIV/AIDS, compared with 98 percent of men, and 85 percent of women know that having just one uninfected partner who has no other partners can reduce the chance of getting HIV/AIDS, compared with 98 percent of men.

Only 49 percent of women and 67 percent of men in Goa have a 'comprehensive knowledge' about HIV/AIDS. This means they know that consistent use of condoms every time they have sex and having just one uninfected sex partner who has no other partners can reduce the chance of getting HIV/AIDS, they know that a healthy-looking person can have HIV/AIDS, and they reject two common misconceptions about the transmission or prevention of HIV/AIDS.

Do people know how to prevent HIV/AIDS?

Percentage of women and men age 15-49

HIV-related stigma

Four-fifths of women and men in Goa would be willing to take care of a relative with HIV/AIDS in their home. More than 9 out of 10 women (91%) and men (95%) say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching. Eighty percent of women and 83 percent of men say that they would buy fresh vegetables from a shopkeeper with HIV/AIDS. Seventy-eight percent of women and only 38 percent of men say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret. An almost equal proportion of women (91%) and men (93%) say that an HIV positive student should be allowed to attend school with students who are HIV negative. Sixty-nine percent of women and 57 percent of men think that people living with HIV/AIDS should be treated in the same public hospital as persons who are HIV negative. An almost equal proportion of women (86%) and men (87%) think that people living with HIV should be allowed to work in the same office with people who are HIV negative.

HIV testing prior to NFHS-5, blood transfusions, and safe injections

About half of women (49%) and 29 percent of men age 15-49 had ever been tested for HIV prior to NFHS-5. Women and men in rural areas are somewhat more likely to have ever been tested for HIV prior to NFHS-5 than urban women and men.

About half of women (49%) and 29 percent of men age 15-49 had ever been tested for HIV prior to NFHS-5.

In Goa, 4 percent of women and 20 percent of men have ever had a blood transfusion. Women are more likely than men to have received an injection in the past 12 months (57% of women, compared with 40% of men). A disposable syringe was used for injections for 91 percent of adults who received an injection in the past 12 months.

SEXUAL BEHAVIOUR

NFHS-5 included questions on respondents' sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, higher-risk intercourse, and condom use. In addition, men were asked whether they had paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.

Higher-risk behaviour

Higher-risk sex is sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who had sex in the past 12 months, only 9 percent of women and 17 percent of men reported having had higher-risk sex during the past 12 months. The percentage of men who had higher-risk sexual intercourse in the past 12 months is somewhat higher (19%) in urban areas than in rural areas (13%). Only 2 percent of men said that they had multiple sex partners in the past 12 months. Four percent of men said they had paid for sex in the past year.

WOMEN'S EMPOWERMENT

Empowering women and promoting gender equality in every sphere of life are essential to improving their lives and achieving the Sustainable Development Goals. NFHS-5 has collected information related to women's empowerment and autonomy, including menstrual hygiene, employment and earnings, decision-making, ownership of assets, gender role attitudes, and domestic violence.

Women's hygiene

Using a hygienic method of menstrual protection is important for women's health and personal hygiene. In NFHS-5, young women age 15-24 were asked what method or methods they use for menstrual protection, if anything. In Goa, 93 percent use sanitary napkins, 34 percent use cloth, and 4 percent use locally prepared napkins. Overall, 97 percent of women age 15-24 use a hygienic method of menstrual protection, up from 89 percent in NFHS-4.

Employment and earnings

Only one-third of all women age 15-49, compared with 78 percent of men, were employed in the 12 months preceding the survey. Among employed women, 96 percent earned cash, including 3 percent who earned both cash and in-kind. Four percent were not paid at all. All men who were employed earned cash. A large majority (80%) of employed women work in non-agricultural occupations, compared with 94 percent of employed men.

Among currently married women who work and are paid in cash, 99 percent decide how their earnings will be used, either alone or jointly with their husbands. Two-fifths (42%) of women who work for cash and whose husbands earn in cash say that they earn more than or about the same as their husbands. Forty-two percent of currently married men who have wives who have cash earnings report that they alone or jointly with their wives decide how her earnings are used, and one-fifth of men who have cash earnings and whose wives have cash earnings say that their wife earns more than or about the same as them.

Only one-third of all women age 15-49 were employed in the 12 months preceding the survey.

Decision making

Currently married women were asked who makes decisions about their own health care, major household purchases, and visits to their own family or relatives. Between 86 to 89 percent of women say that they alone or jointly with their husband participate in decisions about their own health care, about visits to their own family and relatives and about major household purchases. Overall, 81 percent currently married women participate in making all three of these decisions, and 7 percent do not participate in making any of the three decisions.

In the case of currently married men, they are much more likely than women to report that they alone or jointly with their wives participated in making decisions about their own health care (99%) and 96 percent participated in decisions about major household purchases. Two percent of men did not participate in making either of these decisions.

Other indicators of women's empowerment

In Goa, 64 percent of women have money that they can decide how to use. The proportion of women who have money that they can decide how to use is higher among rural (66%) than urban (62%) women, and is highest among women who are employed for cash (89%) than any other group of women.

Eighty-eight percent of women have a bank or savings account that they themselves use.

Eighty-eight percent of women have a bank or savings account that they themselves use. Women's knowledge and use of microcredit programmes is limited. Seventy-five percent of women know of a microcredit programme in their area, but only 10 percent have ever taken a loan from a microcredit programme.

Nearly half of women (48%) who have a mobile phone use it for financial transactions. Urban women are more (56%) likely to use a mobile phone for financial transactions, than rural women (38%). This percentage increases with education. Three-fifths of employed women and have a mobile phone use a mobile phone for financial transactions, compared with 42 percent of unemployed women who have a mobile phone.

Ownership of assets

Less than one-quarter of women (23%) and men (21%) age 15-49 in Goa own a house alone or jointly with someone else, and 9 percent of women and 5 percent of men own land alone or jointly with someone else.

Twenty-three percent of women own a house alone or jointly with someone else, and 9 percent of women own land alone or jointly with someone else.

In Goa, 91 percent of women have a mobile phone that they themselves use, and among women who have a mobile phone that they themselves use, 94 percent can read SMS messages. Ninety-five percent of urban women have a mobile phone they themselves use, compared with 87 percent of rural women.

Ninety-one percent of women in Goa have a mobile phone that they themselves use.

Gender-role attitudes

Over one-third (35% each) of women and men agree that a husband is justified in hitting or beating his wife under some circumstances. Women are most likely to agree that wife beating is justified if a woman shows disrespect for her in-laws (30%), followed by if she neglects the house or children (20%) and if he suspects her of being unfaithful (16%). Men are most likely to agree that wife beating is justified in some circumstances, especially if the wife shows disrespect for in-laws (30%) or if he suspects her of being unfaithful (29%), and if she neglects the house or children (12%).

Ninety percent of women and 93 percent of men believe that a woman is justified in refusing to have sex with her husband if she knows he has a sexually transmitted disease, if she knows he has intercourse with other women, and if she is tired or not in the mood. Eighty-nine percent of men agree that if a wife refuses to have sex with her husband he does not have a right to get angry and reprimand her, refuse to give her financial support, use force to have sex even if she doesn't want to, or have sex with another woman.

DOMESTIC VIOLENCE

The World Health Organization recognizes that violence against women, particularly domestic or spousal violence, is a major public and clinical health problem and a violation of women's human rights, which also reflects the scale of gender inequality and discrimination against women. The consequences of violence on physical, mental, sexual, and reproductive health often last a lifetime. NFHS-5 collected information on domestic violence from women age 18-49, related to behaviours of her husband that cause physical, sexual or emotional harm, including physical violence, sexual coercion, emotional abuse, and controlling behaviours. Information was also collected on violence during pregnancy and help seeking behaviour for any violence experienced.

In Goa, 20 percent of women age 18-49 have ever experienced physical violence, and 4 percent have ever experienced sexual violence. In all, 20 percent of women experienced physical or sexual violence and 3 percent experienced both physical and sexual violence.

One-fifth of ever-married women age 18-49 in Goa have experienced physical or sexual violence.

Violence during pregnancy

Two percent of women age 18-49 who have ever been pregnant have ever experienced physical violence during one or more of their pregnancies. Rural women (3%) are more likely to experience violence during pregnancy than urban women (1%).

Spousal violence

In Goa, 7 percent of ever-married women age 18-49 have experienced any form of physical violence committed by their husband, 5 percent have experienced any form of sexual violence committed by their husband, and 6 percent have experienced any form of emotional violence committed by their husband. Seven percent of ever-married women report having been slapped by their husband. Four percent report being pushed, shaken, or having something thrown at them. Three percent experienced having their arm twisted or hair pulled, 2 percent report being punched with a fist or something that could hurt her.

Five percent of ever-married women age 18-49 report that their husbands have physically forced them to have sex even when they did not want to, and 3 percent report that their husband forced them with threats or in any other way to perform sexual acts they did not want to perform. Overall, 8 percent of ever-married women have experienced spousal physical or sexual violence from their current husband or, if not currently married, from their most recent husband. Few ever-married women (2%) reported that they have initiated violence against their husband when he was not already beating or physically hurting them.

Is alcohol use related to spousal physical or sexual violence?

Percentage of ever-married women experiencing violence

Note: Categories "Husband drinks alcohol, but never gets drunk" and "Husband gets drunk often" not shown since there are fewer than 25 unweighted cases.

The experience of spousal violence is higher among women in rural areas (15%) than in urban areas (6%).

Help seeking

Only 10 percent of women age 18-49 who have ever experienced physical or sexual violence sought help, while 15 percent never sought help but told someone. More than three-fourths of women (76%) never sought help and never told anyone.

Table 1 Results of the household and individual interviews

Number of households, number of interviews with women and men, and response rates, according to residence, Goa, 2019-21

Result	Residence		Total
	Urban	Rural	
Household interviews			
Households selected	1,172	723	1,895
Households occupied	1,166	723	1,889
Households interviewed	1,143	713	1,856
Household response rate ¹	98.0	98.6	98.3
Interviews with women age 15-49			
Number of eligible women	1,268	799	2,067
Number of eligible women interviewed	1,240	790	2,030
Women response rate ²	97.8	98.9	98.2
Interviews with men age 15-54			
Number of eligible men	207	119	326
Number of eligible men interviewed	200	113	313
Men response rate ²	96.6	95.0	96.0

Note: Eligible women and men are women age 15-49 and men age 15-54 who stayed in the household the night before the household interview (including both usual residents and visitors). This table is based on the unweighted sample.

¹ Households interviewed/households occupied

na = Not applicable

¹ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals. The remaining households are non-nuclear households.

² Protected dug well, protected spring, rainwater, community RO plant, tanker truck, cart with small tank, bottled water

³ Defined as drinking water from an improved source, provided either water is on the premises or round-trip collection time is 30 minutes or less. Includes safely managed drinking water, which is not shown separately.

⁴ Drinking water from an improved source, provided round-trip collection time is more than 30 minutes or is unknown.

⁵ Total may add to more than 100.0 because households may use more than one method of treatment

⁶ Appropriate water treatment methods are boiling, adding bleach/chlorine tablets, filtering, electronic purifying, and solar disinfection

⁷ Includes ventilated improved pit (VIP) latrine/biogas latrine, and twin pit/composting toilet

⁸ Facilities that would be considered improved if they were not shared by two or more households

⁹ Defined as use of improved facilities that are not shared with other households.

¹⁰ Defined as use of improved facilities shared by two or more households.

¹¹ Houses made from mud, thatch, or other low-quality materials are called *kachha* houses, houses that use partly low-quality and partly high-quality materials are called semi-*pucca* houses, and houses made with high quality materials throughout, including the floor, roof, and exterior walls, are called *pucca* houses.

¹² Electricity, LPG/natural gas, biogas

¹³ Includes coal/lignite, charcoal, wood, straw/shrubs/grass, agricultural crop waste, and dung cakes

¹⁴ Frequency of smoking by anyone inside the house

Table 5 Access to a toilet facility

Percentage of households having access to a toilet facility by selected background characteristics, according to residence, Goa, 2019-21

Background characteristic	Urban	Rural	Total
Religion of household head			
Hindu	98.4	91.4	95.6
Muslim	97.9	(95.2)	97.2
Christian	99.1	99.4	99.2

Total	100.0	100.0	100.0	100.0	100.0
Number of users	410	36	31	375	857

Note: All information in this table is based on women's reports. Table includes all users of modern contraceptive methods regardless of their marital status. Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. All modern methods include male sterilization, injectables, and emergency contraception, which are not shown separately.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device; AYUSH = Ayurveda, yoga and naturopathy, unani, siddha and homeopathy; UHC = Urban health centre; UHP = Urban health post; UFWC = Urban family welfare centre; CHC = Community health centre; PHC = Primary health centre; ANM = Auxiliary nurse midwife; ICDS = Integrated Child Development Services; ASHA = Accredited Social Health Activist; NGO = Nongovernmental organization; TBA = Traditional birth attendant

¹Excludes standard days method, lactational amenorrhoea method (LAM), and "other" modern methods

Table 32 Informed choice

Among women who are current users of selected modern contraceptive methods who started the last episode of use within the 5 years preceding the survey, percentage who were informed about possible side effects or problems of that method, percentage who were informed about what to do if they experienced side effects, percentage who were ever told by a health or family planning worker about other methods of family planning they could use, and percentage who were informed of all three (Method Information Index) by method, Goa, 2019-21

Method	Percentage who were informed about side effects or problems of method used	Percentage who were informed about what to do if experienced side effects	Percentage who were informed by a health or family planning worker of other methods that could be used	Percentage who were informed about all three (Method Information Index)	Number of women
Female sterilization ¹	85.3	74.2	89.1	72.2	59
Pill	(79.1)	(60.2)	(90.0)	(60.2)	25
Total	85.2	69.2	91.1	68.0	100

Note: Table includes only the contraceptive methods separately shown in the table and excludes users who obtained their method from friends/relatives or husband. Figures in parentheses are based on 25-49 unweighted cases. Total includes users of IUD or PPIUD, who are not shown separately.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device

¹ Among women who were sterilized in the 5 years preceding the survey

Table 33 Twelve-month contraceptive discontinuation rates

Among women age 15-49 who started an episode of contraceptive use within the 5 years preceding the survey, percentage of episodes discontinued within 12 months, by reason for discontinuation and specific method, Goa, 2019-21

Method	Reason for discontinuation								Switched to another method ⁴	Number of episodes of use ⁵
	Method failure	Desire to become pregnant	Other fertility related reason ¹	Side effects/ health concerns	Wanted more effective method	Other method related reason ²	Other reason	Any reason ³		
All modern spacing methods ⁶	1.2	9.2	20.8	12.2	5.8	2.0	7.9	59.2	6.2	970
All spacing methods ⁷	1.1	9.4	20.4	10.4	7.0	1.8	8.0	58.0	6.2	1,194
All methods	1.0	8.9	19.2	9.8	6.6	1.7	7.6	54.8	5.8	1,264

Note: Figures are based on life table calculations using information on episodes of contraceptive use that occurred 3-62 months preceding the survey. All methods include users of pill, IUD or PPIUD, rhythm, withdrawal, and other methods, which are not shown separately.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device

¹ Includes infrequent sex/husband away, difficult to get pregnant/menopausal, and marital dissolution/separation

² Includes lack of access/too far, costs too much, and inconvenient to use.

³ Reasons for discontinuation are mutually exclusive and add to the total given in this column.

⁴The episodes of use included in this column are a subset of the discontinued episodes included in the discontinuation rate. A woman is considered to have switched to another method if she used a different method in the month following discontinuation or if she gave "wanted a more effective method" as the reason for discontinuation and started another method within 2 months of discontinuation.

⁵ All episodes of use that occurred within the 5 years preceding the survey are included. Number of episodes of use includes both episodes of use that were discontinued during the period of observation and episodes of use that were not discontinued during the period of observation.

⁶ Includes pill, IUD/PPIUD, injectables, male condom, female condom, lactational amenorrhoea method (LAM), diaphragm, foam/jelly, and other modern spacing methods.

⁷ Includes pill, IUD/PPIUD, injectables, male condom, female condom, lactational amenorrhoea method (LAM), diaphragm, foam/jelly, rhythm, withdrawal, and other modern spacing and traditional methods.

Table 34 Men's contraception-related perceptions and knowledge

Percentage of men age 15-49 who agree with two specific statements about women and contraception, and percent distribution of men according to their belief about the efficacy of condoms in preventing pregnancy, by background characteristics, Goa, 2019-21

Background characteristic	Percentage of men who agree		Percentage of men who say that if a male condom is used correctly, it protects against pregnancy:				Total	Number of men
	Contraception is women's business and a man should not have to worry about it	Women who use contraception may become promiscuous	Most of the time	Sometimes	Not at all	Don't know/unsure ¹

Table 35 Need and demand for family planning among currently married women—Continued

Percentage of currently married women age 15–49 with unmet need for family planning, percentage with met need for family planning, the total demand for family planning, and the percentage of the demand for contraception that is satisfied, by background characteristics, Goa, 2019–21

Background characteristic	Unmet need for family planning		Met need for family planning (currently using)		Total demand for family planning ¹		Number of women	Percentage of demand satisfied ²	Percentage of demand satisfied by modern methods ³		
	For spacing	For limiting	For spacing	For limiting	For spacing	For limiting					
	Total	Total	Total	Total	Total	Total					
Caste/tribe											
Scheduled caste	4.3	2.6	17.8	59.1	76.9	22.1	61.6	83.7	76	91.8	86.8
Scheduled tribe	6.0	1.9	10.6	48.1	58.7	16.5	50.0	66.5	120	88.2	82.8
Other backward class	1.4	5.0	19.4	49.8	69.2	20.8	54.8	75.6	260	91.5	80.0
Other	4.5	4.6	19.6	48.4	68.0	24.2	53.0	77.2	827	88.1	77.0
Don't know	*	*	*	*	*	*	*	*	3	76.0	76.0
Total	4.0	4.4	18.7	49.2	67.9	22.7	53.6	76.3	1,286	89.0	78.7

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

¹ Total demand is the sum of unmet need and met need

² Percentage of demand satisfied is met need divided by total demand

³ Modern methods include female sterilization, male sterilization, pill, IUD/PIIUD, injectables, male condom, female condom, standard days method, diaphragm, foam/jelly, lactational amenorrhoea method (LAM), other modern methods

Table 36 Unmet need for family planning by district

Percentage of currently married women age 15-49 with unmet need for family planning by district, Goa, 2019-21 and total for NFHS-4

District	Total unmet need	Unmet need for spacing	Unmet need for limiting	Number of women
North Goa	9.2	4.5	4.7	763
South Goa	7.2	3.3	3.9	523
Goa	8.4	4.0	4.4	1,286
NFHS-4 (2015-2016)	17.5	8.3	9.2	1,115

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International Calverton, Maryland, USA.

Table 37 Hysterectomy

Percentage of women age 15-49 who have had a hysterectomy, and among women with a hysterectomy, median age at the time of hysterectomy and percent distribution by place the hysterectomy was performed, according to background characteristics, Goa, 2019-21

Background characteristic	Percentage of women who have had a hysterectomy	Number of women	Median age at time of hysterectomy	Number of women who reported age at hysterectomy	Place of hysterectomy			Total	Number of women with a hysterectomy
					Percentage performed in the public health sector	Percentage performed in the private health sector ¹	Percentage performed elsewhere or don't know where it was performed		
Age

Note: Figures in parentheses are based on 25-49 unweighted cases.

na = Not applicable due to censoring

a = Omitted because less than 50 percent of the women or men were married, began living with their spouse, or had sexual intercourse for the first time before reaching the beginning of the age group.

Table 41 Early childhood mortality rates

Neonatal, postneonatal, infant, child, and under-five mortality rates for five-year periods preceding the survey and for 0-4 years before NFHS-4 and NFHS-3, Goa, 2019-21

Years preceding the survey	Neonatal mortality (NN)	Postneonatal mortality ¹ (PNN)	Infant mortality (₁ Q ₀)	Child mortality (₄ Q ₁)	Under-five mortality (₅ Q ₀)
0-4	(5.6)	(0.0)	(5.6)	(5.0)	(10.6)
5-9	(3.7)	(8.8)	(12.4)	(0.0)	(12.4)
10-14	(3.7)	(3.6)	(7.2)	(9.5)	(16.7)
NFHS-4 (0-4)	(12.9)	(0.0)	(12.9)	(0.0)	(12.9)
NFHS-3 (0-4)	8.8	6.5	15.3	5.0	20.3

Note: All estimates are for the 5 years preceding the survey (approximately 2001-2005 for NFHS-3, 2011-2015 for NFHS-4 and 2015-2019 for NFHS-5). Figures in parentheses are based on 250-499 unweighted person-years of exposure to the risk of death.

¹ Computed as the difference between the infant and neonatal mortality rates

Table 43 High-risk fertility behaviour

Percent distribution of children born in the 5 years preceding the survey by category of elevated risk of mortality and percent distribution of currently married women by category of risk if they were to conceive a child at the time of the survey, Goa, 2019-21

Risk category	<u>Births in the 5 years preceding the survey</u> Percentage of births	Percentage of currently married women ¹
Not in any high-risk category	24.8	42.7 ^a
Unavoidable risk category		
First order births between ages 18 and 34 years	48.2	8.6
Single high-risk category		
Mother's age <18	2.2	0.0
Mother's age >34	15.2	35.8
Birth interval <24 months	7.5	5.3
Birth order >3	0.4	1.2
Subtotal	25.3	42.3
Multiple high-risk category		
Mother's age >34 and birth interval <24 months	0.4	1.6
Mother's age >34 and birth order >3	0.9	4.2
Mother's age >34 and birth interval <24 months and birth order >3	0.0	0.0
Birth interval <24 months and birth order >3	0.4	0.5
Subtotal	1.7	6.4
In any avoidable high-risk category	27.0	48.6
Total	100.0	100.0
Number of births	380	1,286

na = Not applicable

¹ Women are assigned to risk categories according to the status they would have at the birth of a child if they were to conceive at the time of the survey: current age less than 17 years and 3 months or greater than 34 years and 2 months, latest birth less than 15 months ago, or latest birth of order 3 or higher

² Includes the category age <18 and birth order >3

^a Includes sterilized women

Table 44 Antenatal care

Percent distribution of women who had a live birth in the 5 years preceding the survey by antenatal care (ANC) provider during pregnancy for the most recent live birth and percentage receiving ANC from a skilled provider, according to background characteristics, Goa, 2019-21

Background characteristic	Doctor	ANM/ nurse/ midwife/ LHV	Dai (TBA)	Anganwadi/ ICDS worker	Community/ village health worker	ASHA	Other	No ANC	Total	Number of women	Percentage receiving ANC from a skilled provider ¹

Total	97.7	0.9	0.0	0.4	0.0	0.0	0.0	0.9	100.0	332	98.7

Note: If more than one source of ANC was mentioned, only the provider with the highest qualification is considered in this table. Figures in parentheses are based on 25-49 unweighted cases. Total includes women with age at birth less than 20 years, women with births of birth order 4 or more, women with no schooling or less than 5 years of schooling, women belonging to other religions, women belonging to scheduled caste or who don't know their caste/tribe, who are not shown separately.

ANM = Auxiliary nurse midwife; LHV = Lady health visitor; TBA = Traditional birth attendant; ICDS = Integrated Child Development Services; ASHA = Accredited Social Health Activist

¹ Skilled provider includes doctor, auxiliary nurse midwife, nurse, midwife, and lady health visitor.

² Not belonging to scheduled caste, scheduled tribe, or other backward class

Table 45 Antenatal care services and information received

Percent of women who had a live birth in the 5 years preceding the survey who received antenatal care (ANC) for the most recent live birth by services and information received, according to residence and source of antenatal care, Goa, 2019-21

Services/information	Residence		Source of ANC		Total
	Urban	Rural	Public health sector	Private health sector ¹	
Percentage receiving selected services during antenatal care					
Weighed	100.0	100.0	100.0	100.0	100.0
Blood pressure measured	100.0	100.0	100.0	100.0	100.0
Urine sample taken	100.0	97.9	99.4	98.9	99.2
Blood sample taken	100.0	100.0	100.0	100.0	100.0
Abdomen examined	100.0	99.3	99.6	100.0	99.7
Percentage receiving information on specific pregnancy complications					
Vaginal bleeding	88.2	80.8	88.6	82.0	85.3
Convulsions	84.9	81.5	90.4	82.8	83.6
Prolonged labour	94.5	85.3	93.9	89.3	90.8
Severe abdominal pain	94.8	87.2	92.3	91.5	91.8
High blood pressure	86.2	81.7	89.9	84.6	84.4
Where to go if experienced pregnancy complications	74.4	74.1	83.9	66.5	74.3
Number of women	199	130	209	127	329

Note: Total includes women who received antenatal care at both the public and private health sectors or only at home, who are not shown separately.

¹ Includes nongovernmental organizations and trust hospitals/clinics

Table 46 Antenatal care indicators

Among women with a live birth in the 5 years preceding the survey, percentage who received different types of antenatal care (ANC) during the pregnancy for their most recent live birth, by background characteristics, Goa, 2019-21

Background characteristic	Percentage who had four or more ANC visits	Percentage ANC visit in the first trimester of pregnancy	Percentage who received two or more TT injections during the pregnancy	Percentage whose last live birth was protected against neonatal tetanus ¹	Percentage who were given or bought IFA	Percentage who took IFA for at least 100 days	Percentage who took IFA for at least 180 days	Percentage who took an intestinal parasite drug	Number of women
Mother's age at birth									
20-34	93.3	69.9	84.9	96.2	99.7	87.8	65.1	35.5	258

Total	93.0	70.3	86.5	96.5	99.1	87.5	65.0	35.0	332

Note: Figures in parentheses are based on 25-49 unweighted cases. Total includes women age 15-19, women with births of birth order 4 or more, women with no schooling or less than 5 years of schooling, women belonging to other religions, women belonging to scheduled caste or who don't know their caste/tribe, who are not shown separately.

TT = Tetanus toxoid; IFA = Iron and folic acid

¹ Includes mothers with two injections during the pregnancy for her last live birth, or two or more injections (the last within 3 years of the last live birth), or three or more injections (the last within 5 years of the last live birth), or four or more injections (the last within 10 years of the last live birth), or five or more injections at any time prior to the last live birth

² Not belonging to scheduled caste, scheduled tribe, or other backward class

Table 47 Antenatal care indicators by district

Among women with a live birth in the 5 years preceding the survey, percentage who received different types of antenatal care (ANC) during the pregnancy for their most recent live birth, by district, Goa, 2019-21

District	Percentage who had four or more ANC visits	Percentage with an ANC visit in the first trimester of pregnancy	Percentage who received two or more TT injections during the pregnancy	Percentage whose last live birth was protected against neonatal tetanus ¹	Percentage who were given or bought IFA	Percentage who took IFA for at least 100 days	Percentage who took IFA for at least 180 days	Percentage who took an intestinal parasite drug	Number of women
North Goa	91.3	74.6	84.5	95.8	98.6	84.8	68.4	35.0	212
South Goa	96.0	62.7	90.1	97.8	100.0	92.2	59.1	35.0	120
Goa	93.0	70.3	86.5	96.5	99.1	87.5	65.0	35.0	332

TT = Tetanus toxoid; IFA = Iron and folic acid tablets or syrup

¹ Includes mothers with two injections during the pregnancy for her last live birth, or two or more injections (the last within 3 years of the last live birth), or three or more injections (the last within 5 years of the last live birth), or four or more injections (the last within 10 years of the last live birth), or five or more injections at any time prior to the last live birth.

Table 48 Advice received during pregnancy

Among women with a live birth in the 5 years preceding the survey who met with a community health worker in the last three months of pregnancy for their most recent live birth, percentage who received different types of advice, by background characteristics, Goa, 2019-21

Background characteristic	Percentage who received advice on:					Number of women who met with a community health worker in the last three months of pregnancy ¹
	Importance of institutional delivery	Cord care	Breastfeeding	Keeping the baby warm	Family planning	
Mother's age at birth						
20-34	96.0	99.4	99.6	95.0	94.7	211

Note: Figures in parentheses are based on 25-49 unweighted cases. Total includes pregnancies of women age 15-19, pregnancies of birth order 4 or more, pregnancies of women with no schooling or less than 5 years of schooling, pregnancies of women belonging to other religions, and pregnancies of women belonging to scheduled caste or who don't know their caste/tribe, which are not shown separately.

¹ Not belonging to scheduled caste, scheduled tribe, or other backward class

Table 51 Delivery and postnatal care

Percent distribution of live births to women age 15-49 in the 5 years preceding the survey by place of delivery and assistance during delivery, percentage of live births delivered by a skilled provider and by caesarean section, and percent distribution of women giving birth in the 5 years preceding the survey by timing and type of provider of the first postnatal check of the mother for their most recent live birth, by residence, Goa, 2019-21

Delivery and postnatal care descriptors	Urban	Rural	Total
Place of delivery			
Health facility	99.6	100.0	99.7
Public sector	53.1	61.1	56.2
Private sector	46.5	38.9	43.5
At home	0.4	0.0	0.3
Own home	0.4	0.0	0.3
Total	100.0	100.0	100.0
Assistance during delivery²			
Doctor	94.0	96.9	95.1
ANM/nurse/midwife/LHV	4.6	3.1	4.0
Friends/relatives	1.0	0.0	0.6
No one	0.4	0.0	0.3
Total	100.0	100.0	100.0
Percentage of all births delivered by a skilled provider ³	98.6	100.0	99.1
Percentage delivered by caesarean section	39.1	40.1	39.5
Percentage delivered by emergency caesarean section ⁴	15.4	25.4	19.2
Number of births	234	146	380
Timing after delivery of mother's first postnatal check⁶			
Less than four hours	83.2	86.8	84.7
4-23 hours	7.3	1.4	5.0
1-2 days	6.0	5.5	5.8
3-41 days	0.5	2.6	1.4
No postnatal check	3.0	3.6	3.2
Total	100.0	100.0	100.0
Type of provider of mother's first postnatal check⁶			
Doctor	92.1	84.5	89.1
ANM/nurse/midwife/LHV	4.2	11.8	7.2
Other health personnel	0.8	0.0	0.5
No postnatal check	3.0	3.6	3.2
Total	100.0	100.0	100.0
Number of last live births	201	132	332

NGO = Nongovernmental organization; ANM = Auxiliary nurse midwife; LHV = Lady health visitor; TBA = Traditional birth attendant

¹ Includes missing

² If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this table

³ Skilled health personnel includes doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, and other health personnel

⁴ A caesarean section for which the decision to have the operation was made after the onset of labour

⁵ Based on the last live birth in the five years preceding the survey

⁶ Based on the last live birth in the five years preceding the survey. Postnatal checks are checks on the woman's health within 42 days of the birth

Table 52. Delivery and postnatal care by background characteristics

Percentage of live births in the 5 years preceding the survey delivered in a health facility and percentage delivered with assistance from health personnel, and percentage of women who had a live birth in the 5 years preceding the survey who received a postnatal check and who received a postnatal check within 2 days of birth for their most recent birth, and among births in the year preceding the survey, percentage of deliveries assisted by health personnel, by background characteristics, Goa, 2019-21

Background characteristic	Percentage of births delivered in a public health facility	Percentage of births delivered in a private health facility	Percentage of births delivered in a health facility	Percentage of deliveries assisted by health personnel ¹	Number of births	Percentage of women with a postnatal check ^{2,3}	Percentage of women with a postnatal check within two days of birth ^{2,3}	Number of women	Among births in the year preceding the survey:

Table 52 Delivery and postnatal care by background characteristics — *Continued*

Background characteristic	Percentage of births delivered		Percentage of deliveries assisted by health personnel ¹		Percentage of women with a postnatal check within two days of birth ^{2,3}		Among births in the year preceding the survey:	
	in a public health facility	in a private health facility	of births delivered in a health facility	of deliveries assisted by health personnel ¹	Percentage of women with a postnatal check within two days of birth ^{2,3}	Percentage of deliveries assisted by health personnel ¹	Number of women	Number of births
Place of delivery								
Public health facility	100.0	0.0	100.0	98.9	96.8	96.2	185	49
Private health facility ⁴	0.0	100.0	100.0	100.0	96.7	94.3	146	40
Total	56.2	43.5	99.7	99.1	96.8	95.4	332	89

Note: Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. Total includes information on births to women age 15-19, births of birth order 4 or more, births to women with no schooling or less than 5 years of schooling, births to women belonging to other religions, and births to women who don't know their caste/tribe, which is not shown separately.

¹ Health personnel includes doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, and other health personnel. If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this table.

² For the most recent birth in the 5 years preceding the survey

³ Postnatal checks are checks on the woman's health within 42 days of the birth

⁴ Includes nongovernmental organizations or trust hospitals/clinics

Table 53 Delivery and postnatal care by district

Percentage of live births in the 5 years preceding the survey delivered in a health facility, percentage delivered with assistance from health personnel, and percentage delivered by caesarean section, and percentage of women who had a live birth in the 5 years preceding the survey who received a postnatal check within two days of birth for their most recent birth, by district, Goa, 2019-21

District	Percentage of births delivered in a public health facility	Percentage of births delivered in a private health facility	Percentage of births delivered in a health facility	Percentage of deliveries assisted by health personnel ¹	Percentage of births delivered by caesarean section	Number of births	Percentage of women with postnatal check within two days of delivery ²	Number of women
North Goa	58.6	41.0	99.6	98.6	39.5	240	93.1	212
South Goa	52.0	48.0	100.0	100.0	39.4	140	99.5	120
Goa	56.2	43.5	99.7	99.1	39.5	380	95.4	332

¹ Health personnel includes doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, and other health personnel. If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this table.

² Postnatal checks are checks on the woman's health within 42 days of birth.

Table 54 Delivery costs and financial assistance

The average out-of-pocket cost paid for delivery for the most recent live birth among women who had a live birth in the 5 years preceding the survey that was delivered in a health facility by type of facility, and among women who had a live birth in the 5 years preceding the survey for the most recent birth that was delivered in a health facility, percentage who received financial assistance under *Janani Suraksha Yojana (JSY)*, according to background characteristics, Goa, 2019-21

Background characteristic	Average cost (Rs.) ¹			Percentage who received financial assistance under JSY	Number of births in a health facility
	Public health facility	Private health facility	Any health facility		
Mother's age at birth					
20-34	3,952	34,077	16,637	8.5	256

Other ²	4,003	34,392	18,725	9.5	212
Total	3,804	36,165	18,511	7.2	331

Note: Figures in parentheses are based on 25-49 unweighted cases. Total includes information on births with mother's age at birth 15-19, births of birth order 4 or more, births to women with no schooling or less than 5 years of schooling, births to women belonging to other religions, and births to women belonging to scheduled caste or who don't know their caste/tribe, which is not shown separately.

¹ Excludes women who don't know the cost

² Not belonging to scheduled caste, scheduled tribe, or other backward class

Table 55 Birth order and delivery characteristics by district

Percentage of births during the 3 years preceding the survey of birth order 3 or more, percentage of women who had a live birth, in the 5 years preceding the survey by antenatal care (ANC) provider during pregnancy for the most recent live birth and among women who had a live birth in the 5 years preceding the survey for the most recent birth that was delivered in a health facility, the percentage of women who received financial assistance under *Janani Suraksha Yojana* (JSY) by district, Goa, 2019-21

District	Percentage of births of birth order 3 or more	Number of births	Percentage of last births receiving antenatal care from doctor	Percentage of last births receiving antenatal care from ANM/nurse/midwife/LHV	Number of last births	Percentage of births in a health facility receiving financial assistance under JSY	Number of births in a health facility
North Goa	9.2	140	96.8	16.5	212	9.0	211
South Goa	10.9	79	99.4	14.2	120	4.2	120
Goa	9.8	220	97.7	15.7	332	7.2	331

ANM = Auxiliary nurse midwife; LHV = Lady health visitor

Table 56 Timing of first health check after birth for the newborn

Percent distribution of last births in the 5 years preceding the survey by time after birth of first health check, and the percentage of births with a health check in the first two days after birth, according to background characteristics, Goa, 2019-21

Background characteristic	Time between delivery and newborn's first postnatal health check						No postnatal health check ¹	Total	Percentage of births with a health check in the first two days after birth	Number of births
	Less than 1 hour	1-3 hours	4-23 hours	1-2 days	3-6 days	Don't know/missing				
Mother's age at birth

Total	10.5	77.6	4.3	4.8	0.7	0.0	1.2	100.0	97.2	332

Note: Figures in parentheses are based on 25-49 unweighted cases. Total includes information on births with mother's age at birth less than 20 years, births of birth order 4 or 5, births delivered at home, births to women belonging to other religions, births to women belonging to scheduled caste or who don't know their caste/tribe, and births to women with no schooling or less than 5 years of schooling, which is not shown separately.

¹ Includes newborns who received a health check after the first week

² Includes nongovernmental organization or trust hospital/clinic

³ Not belonging to scheduled caste, scheduled tribe, or other backward class

Table 57 Trends in maternal care indicators

Maternal care indicators for births during the 5 years preceding the survey by residence, NFHS-5 and NFHS-4, Goa

Indicator	NFHS-5 (2019-21)	NFHS-4 (2015-16)
URBAN		
Percentage who received antenatal care ¹	98.7	97.7
Percentage who had at least four antenatal care visits ¹	92.3	90.6
Percentage who received antenatal care within the first trimester of pregnancy ¹	64.0	84.6
Percentage of births delivered in a health facility ²	100.0	95.8
Percentage of deliveries assisted by health personnel ^{2, 3}	99.6	97.5
RURAL		
Percentage who received antenatal care ¹	98.0	96.1
Percentage who had at least four antenatal care visits ¹	92.4	86.2
Percentage who received antenatal care within the first trimester of pregnancy ¹	73.6	83.9
Percentage of births delivered in a health facility ²	100.0	98.8
Percentage of deliveries assisted by health personnel ^{2, 3}	100.0	97.6
TOTAL		
Percentage who received antenatal care ¹	98.4	97.1
Percentage who had at least four antenatal care visits ¹	92.3	89.0
Percentage who received antenatal care within the first trimester of pregnancy ¹	68.0	84.4
Percentage of births delivered in a health facility ²	100.0	96.9
Percentage of deliveries assisted by health personnel ^{2, 3}	99.8	97.5

¹ Based on the last birth to women in the 5 years preceding the survey

² Based on all births in the 5 years preceding the survey

³ Doctor, auxiliary nurse midwife (ANM), nurse, midwife, lady health visitor (LHV), or other health personnel

Table 59. Vaccinations by source

Percentage of children age 12-23 months who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report), and percentage with a vaccination card seen by the interviewer, NFHS-5 and NFHS-4, Goa

Source	Hepatitis B or Penta ¹			DPT or Penta			Polio ²			MCV/ Measles/ MMR/MR	All basic vaccinations ³	All age appropriate vaccinations ⁴	No vaccinations ⁵	Percentage with a vaccination card seen	Number of children			
	BCG	0	1	2	3	0	1	2	3									
NFHS-5 (2019-21)	97.9	80.2	96.5	95.7	92.8	97.9	97.1	90.8	92.0	97.9	97.9	88.3	92.9	81.9	69.3	2.1	88.0	71
NFHS-4 (2015-16)	100.0	91.5	91.8	90.0	85.2	95.9	95.4	94.2	97.6	100.0	98.7	92.9	96.5	88.4	na	0.0	90.3	85

Note: Children are considered to have received the vaccine if it was either written on the child's vaccination card or reported by the mother. For children whose vaccination information is based on the mother's report, the date of vaccination is not collected. The proportions of vaccinations given during the first year of life are assumed to be the same as for children with a written record of vaccination.

na = Not applicable

¹ Hepatitis B 0 is the hepatitis vaccination given at birth. There is no Penta 0 vaccine.

² Polio 0 is the polio vaccination given at birth

³ BCG, MCV/Measles/MMR/MR, and three doses each of DPT/Penta and polio vaccine (excluding polio vaccine given at birth)

⁴ BCG, MCV/Measles/MMR/MR, four doses of hepatitis B/Penta, and three doses each of DPT/Penta and polio vaccine (excluding polio vaccine given at birth)

⁵ Child has not received any vaccinations listed in the table.

Table 61 Prevalence and treatment of symptoms of ARI and fever

Among children under age 5 years, percentage who had symptoms of acute respiratory infection (ARI) and fever in the 2 weeks preceding the survey and among children with symptoms of ARI and fever in the 2 weeks preceding the survey, percentage for whom advice or treatment was sought from a health facility or provider, according to background characteristics, Goa, 2019-21

Background characteristic	Children under age five			Children under age five with fever	
	Percentage with symptoms of ARI ¹	Percentage with fever	Number of children	Percentage for whom treatment was sought from a health facility or provider ²	Number of children

Table 65 Indicators of utilization of ICDS services—Continued

Percentage of children under age 6 years who received any service and received specific services from an *anganwadi* centre (AWC) in the 12 months preceding the survey, by background characteristics, Goa, 2019-21

Background characteristic	Percentage of children age 0-71 months who received from an AWC				Children age 36-71 months			Children age 0-59 months		Children age 0-59 months who were weighed at an AWC
	Any services	Supplementary food ¹	Any immunizations	Health check-ups	Number of children	Percentage who went for early childhood care/preschool	Number of children	Percentage of children who were weighed at an AWC	Number of children	Percentage whose mothers received counselling from an AWC after child was weighed
Religion										
Hindu	68.9 (70.2)	65.7 (69.1)	40.6 (40.5)	56.9 (61.8)	324 47	46.4 (44.0)	165 27	66.7 (58.8)	267 37	72.6 *

Note: Table is based on children who stayed in the household the night before the interview. Each of the indices is expressed in standard deviation (SD) units from the median of the WHO Child Growth Standards. Table is based on children with valid dates of birth (month and year) and valid measurement of both height and weight. Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. Total includes children age 6-11 months, children of birth order 4 or 5, children whose size at birth is very small, children of mothers with no schooling or less than 5 years of schooling, children belonging to other religions, children who have no caste/tribe or whose caste/tribe is missing, and children whose mother's nutritional status is missing, who are not shown separately.

BMI = Body mass index

¹ Recumbent length is measured for children under age 2; standing height is measured for all other children

² Includes children who are below -3 standard deviations (SD) from the WHO Child Growth Standards population median

³ Excludes children whose mothers were not interviewed

⁴ First-born twins (triplets, etc.) are counted as first births because they do not have a previous birth interval

⁵ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.

⁶ Excludes children whose mothers were not weighed and measured, children whose mothers were not interviewed, and children whose mothers are pregnant or gave birth within the preceding 2 months. Mother's nutritional status in terms of BMI (Body Mass Index) is presented in Table 78.

Table 68 Initial breastfeeding

Among last-born children who were born in the 2 years preceding the survey, percentage who were ever breastfed, and percentages who started breastfeeding within 1 hour and 1 day of birth, and among last-born children born in the 2 years preceding the survey who were ever breastfed, percentage who received a prelacteal feed in the first 3 days after birth, by background characteristics, Goa, 2019-21

Background characteristic	Among last-born children born in the past 2 years:				Among last-born children born in the past 2 years who were ever breastfed:	
	Percentage ever breastfed	Percentage who started breastfeeding within 1 hour of birth	Percentage who started breastfeeding within 1 day of birth ¹	Number of last-born children	Percentage who received a prelacteal feed ²	Number of last-born ever breastfed children

Christian	(100.0)	(74.6)	(95.9)	27	(5.4)	27
Caste/tribe						
Other backward class	(100.0)	(64.4)	(87.6)	26	(12.4)	26
Other ³	100.0	69.6	97.4	90	6.9	90
Total	100.0	62.2	92.6	147	9.9	147

Note: Table is based on last-born children born in the 2 years preceding the survey regardless of whether the children are living or dead at the time of the interview. Figures in parentheses are based on 25-49 unweighted cases. Total includes children of mothers with no schooling or less than 10 years of schooling, Muslim children, and children belonging to scheduled caste or scheduled tribe, who are not shown separately.

TBA = Traditional birth attendant

¹ Includes children who started breastfeeding within 1 hour of birth

² Children given something other than breast milk during the first 3 days of life

³ Not belonging to scheduled caste, scheduled tribe, or other backward class

Table 69 Breastfeeding status by age

Percent distribution of youngest children under age 2 years living with the mother by breastfeeding status and percentage currently breastfeeding, and percentage of all children under age 2 years using a bottle with a nipple, according to age in months, Goa, 2019-21

Age in months	Breastfeeding and consuming:						Total	Percentage currently breastfeeding	Number of youngest children under age 2 years living with the mother	Percentage using a bottle with a nipple	Number of all children under age 2 years
	Not breastfeeding	Exclusively breastfed	Plain water only	Non-milk liquids ¹	Other milk	Complementary foods					
12-17	(30.1)	(0.0)	(2.6)	(0.0)	(0.0)	(67.4)	100.0	(69.9)	39	(60.6)	40
18-23	(14.6)	(0.0)	(0.0)	(0.0)	(0.0)	(85.4)	100.0	(85.4)	28	(41.0)	32
0-5	(0.0)	(61.4)	(2.8)	(0.0)	(21.5)	(14.3)	100.0	(100.0)	32	(28.8)	33
6-9	(0.0)	(12.2)	(3.5)	(0.0)	(2.2)	(82.1)	100.0	(100.0)	30	(21.6)	31
12-23	23.7	0.0	1.5	0.0	0.0	74.8	100.0	76.3	67	51.9	71

Note: Breastfeeding status refers to a "24-hour" period (yesterday during the day or at night). Children who are classified as breastfeeding and consuming plain water only consumed no liquid or solid supplements. The categories of not breastfeeding, exclusively breastfed, breastfeeding and consuming plain water, non-milk liquids, other milk, and complementary foods (solids and semi-solids) are hierarchical and mutually exclusive, and their percentages add to 100 percent. Thus, children who receive breast milk and non-milk liquids and who do not receive other milk and who do not receive complementary foods are classified in the non-milk liquid category even though they may also get plain water. Any children who get complementary food are classified in that category as long as they are breastfeeding as well. Figures in parentheses are based on 25-49 unweighted cases.

¹ Non-milk liquids include juice, juice drinks, clear broth, and other liquids.

Table 71. Minimum acceptable diet

Percentage of youngest children age 6-23 months living with their mother who are fed a minimum acceptable diet based on breastfeeding status, number of food groups, and times they are fed during the day or night preceding the survey, according to background characteristics, Goa, 2019-21

Background characteristic	Among breastfed children 6-23 months, percentage fed:				Among all children 6-23 months, percentage fed:				
	Minimum dietary diversity ¹	Minimum meal frequency ²	Minimum acceptable diet ³	Number of breastfed children	Breast milk, milk, or milk products ⁴	Minimum dietary diversity ¹	Minimum meal frequency ⁵	Minimum acceptable diet ⁶	Number of all children
Age in months									
6-11	(32.6)	(51.4)	(15.9)	44	(100.0)	(18.6)	(53.6)	(15.2)	46
12-17	(70.6)	(22.6)	(17.6)	27	(96.8)	(51.6)	(33.0)	(18.6)	39
18-23	*	*	*	24	(100.0)	(81.4)	(49.0)	(36.3)	28
Sex									
Male	(59.9)	(42.0)	(25.9)	47	97.8	44.9	50.1	24.2	57
Female	(52.8)	(38.7)	(14.6)	48	100.0	45.8	40.5	18.8	55
Residence									
Urban	63.1	43.1	18.9	51	100.0	48.4	52.4	21.1	65
Rural	(48.3)	(37.0)	(21.8)	44	(97.4)	(41.3)	(35.9)	(22.2)	48
Mother's schooling									
10-11 years complete	(48.3)	(36.9)	(16.6)	30	(100.0)	(38.7)	(37.3)	(18.1)	32
12 or more years complete	(66.7)	(47.2)	(24.3)	48	100.0	49.8	56.4	25.9	62
Total	56.4	40.3	20.2	95	98.9	45.4	45.4	21.5	113

Note: Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. Total includes children age 6-8 or 9-11 months and children of mothers with no schooling or less than 10 years of schooling, who are not shown separately.

¹ Minimum dietary diversity is receiving foods from 5 or more of the following 8 food groups: a. breast milk b. infant formula, milk other than breast milk, cheese or yogurt or other milk products; c. foods made from grains or roots, including porridge or gruel, fortified baby food made from grains; d. vitamin A-rich fruits and vegetables; e. other fruits and vegetables; f. eggs; g. meat, poultry, fish, shellfish, or organ meats; h. beans, peas, lentils, or nuts

² For breastfed children, minimum meal frequency is receiving solid or semi-solid food at least twice a day for infants 6-8 months and at least three times a day for children 9-23 months

³ Breastfed children age 6-23 months are considered to be fed a minimum acceptable diet if they are fed the minimum dietary diversity as described in footnote 1 and the minimum meal frequency as described in footnote 2

⁴ Breastfeeding, or not breastfeeding and receiving two or more feedings of commercial infant formula, fresh, tinned, and powdered animal milk, and yogurt

⁵ Children are fed the minimum recommended number of times per day according to their age and breastfeeding status as described in footnotes 2 and 5

⁶ Children age 6-23 months are considered to be fed a minimum acceptable diet if they receive breast milk, other milk or milk products as described in footnote 7, are fed the minimum dietary diversity as described in footnote 1, and are fed the minimum meal frequency as described in footnotes 2 and 5

Table 72 Child feeding practices and nutritional status of children by district

Among last-born children who were born in the 2 years preceding the survey, percentage who started breastfeeding within 1 hour of birth, percentage of youngest children under age 6 months living with the mother who are exclusively breastfed, and percentage of children under age 5 years classified as malnourished according to three anthropometric indices of nutritional status: height-for-age, weight-for-height, and weight-for-age, by district, Goa, 2019-21

District	Among last born children in the past 2 years		Percentage of children under age 6 months		Height-for-age ²		Weight-for-height		Weight-for-age	
	Percentage breastfed within 1 hour of birth	Number of children	Percentage of exclusively breastfed ¹	Number of children	Percentage below -2 SD ³	Number of children	Percentage below -2 SD ³	Number of children	Percentage below -2 SD ³	Number of children
North Goa	64.7	97	*	21	24.2	213	17.7	211	25.8	217
South Goa	57.2	49	*	11	28.3	134	21.4	133	21.0	135
Goa	62.2	147	(61.4)	32	25.8	347	19.1	344	24.0	352

Note: Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

¹ Based on the youngest child living with the mother

² Recumbent length is measured for children under age 2, or in the few cases when the age of the child is unknown and the child is less than 85 cm; standing height is measured for all other children

³ Based on the WHO Growth Standards population median

Table 73 Prevalence of anaemia in children

Percentage of children age 6-59 months classified as having anaemia, by background characteristics, Goa, 2019-21 and totals for NFHS-4

Background characteristic	Anaemia status by haemoglobin level			Any anaemia (<11.0 g/dl)	Number of children
	Mild (10.0-10.9 g/dl)	Moderate (7.0-9.9 g/dl)	Severe (<7.0 g/dl)		
Age in months

Table 73 Prevalence of anaemia in children—*Continued*

Percentage of children age 6-59 months classified as having anaemia, by background characteristics, Goa, 2019-21 and totals for NFHS-4

Background characteristic	Anaemia status by haemoglobin level			Any anaemia (<11.0 g/dl)	Number of children
	Mild (10.0-10.9 g/dl)	Moderate (7.0-9.9 g/dl)	Severe (<7.0 g/dl)		
Child's living arrangements					
Living with both parents	25.4	24.3	1.7	51.4	249
Living with one or neither parent	(33.5)	(34.8)	(0.0)	(68.3)	29
Mother's anaemia status⁴					
Not anaemic	24.9	19.6	2.1	46.5	157
Mildly anaemic	25.6	34.9	1.3	61.8	76
Moderately/severely anaemic	(34.9)	(26.4)	(0.0)	(61.3)	42
Total	26.3	25.4	1.5	53.2	278
NFHS-4 (2015-16)	29.8	18.1	0.5	48.3	362

Note: Table is based on children who stayed in the household the night before the interview and who were tested for anaemia. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formula (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. *Morbidity and Mortality Weekly Report* 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). Figures in parentheses are based on 25-49 unweighted cases. Total includes children age 6-8 or 9-11 months, children of birth order 4 or 5, children of mothers with no schooling or less than 8 years of schooling, children belonging to other religions, and children belonging to scheduled caste or who have no caste/tribe or whose caste/tribe is missing, who are not shown separately.

¹ Excludes children whose mothers not interviewed and not in the household, who are not shown separately

² For mothers who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.

³ Not belonging to scheduled caste, scheduled tribe, or other backward class

⁴ Mildly anaemic is 11.0-11.9 g/dl for non-pregnant women and 10.0-10.9 g/dl for pregnant women. Moderately/severely anaemic is <11.0 g/dl for non-pregnant women and <10.0 g/dl for pregnant women. Adjusted for altitude and for smoking status. Excludes children whose mother's anaemia status is not known.

Table 74 Micronutrient intake among children

Percentage of youngest children age 6-23 months living with the mother who consumed vitamin A-rich and iron-rich foods in the day or night preceding the survey, percentage of children age 6-23 months who were given multiple micronutrient powder in the last 7 days, who were given iron supplements in the last 7 days, and who were given deworming medication in the last 6 months; percentage of children age 9-35 months who were given vitamin A supplements in the last 6 months; and percentage of children age 6-59 months who live in households using iodized salt, by background characteristics, Goa, 2019-21

Background characteristic	Among youngest children age 6-23 months living with their mother:				Among children age 6-23 months:				Among children age 9-35 months:				Among children age 6-59 months in households with salt tested:

NFHS-4 (2015-16)	17.3	12.3	1.7	31.3	1,689	6.3	4.4	0.3	11.0	756

Note: Table is based on women and men who stayed in the household the night before the interview. Prevalence is adjusted for altitude and for smoking status, if known, using the CDC formulae (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. *Morbidity and Mortality Weekly Report* 47 (RR-3): 1-29). Haemoglobin levels are shown in grams per decilitre (g/dl). Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. Total includes women/men belonging to other religions and women/men who don't know their caste/tribe, who are not shown separately.

na = Not applicable; nc = No cases

¹ For pregnant women the value is 10.0-10.9 g/dl

² For pregnant women, the value is 7.0-9.9 g/dl

³ For pregnant women, the value is <7.0 g/dl

⁴ For pregnant women the value is <11.0 g/dl

Table 81 Nutritional status and anaemia among children and women by district

Percentage of children age 6-59 months classified as having anaemia and percentage of women age 15-49 years with anaemia and specific body mass index (BMI) levels by district, Goa, 2019-21

District	Percentage of children having any anaemia (<11.0 g/dl)	Number of children	Percentage of women having any anaemia (<12.0 g/dl) ¹	Number of women	Percentage of women with BMI <18.5 (total thin)	Percentage of women with BMI ≥25.0 (overweight or obese)	Number of women ²
North Goa	55.2	171	40.0	1,098	14.1	37.2	1,083
South Goa	50.0	107	37.6	851	13.5	34.6	838
Goa	53.2	278	38.9	1,949	13.8	36.1	1,921

Note: Table is based on children who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formula (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. *Morbidity and Mortality Weekly Report* 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). The body mass index (BMI) is expressed as the ratio of weight in kilograms to the square of height in metres (kg/m²).

¹ For pregnant women, the value is <11.0 g/dl

² Excludes pregnant women and women with a birth in the preceding 2 months

Table 82 Knowledge and prevention of HIV/AIDS

Percentage of women and men age 15-49 who have heard of HIV or AIDS and who, in response to prompted questions, say that people can reduce the risk of getting HIV/AIDS by using condoms every time they have sexual intercourse, who know that the risk of getting HIV/AIDS can be reduced by limiting sex to one uninfected partner, who have a comprehensive knowledge about HIV/AIDS, and who know that HIV/AIDS can be transmitted from a mother to her baby, by background characteristics, Goa, 2019-21

Background characteristic	Percentage who have heard of HIV or AIDS		Percentage who say that people can reduce their chances of getting HIV/AIDS by using a condom every time they have sex		Percentage who know that the risk of getting HIV/AIDS can be reduced by limiting sex to one uninfected sex partner ¹		Percentage who have a comprehensive knowledge about HIV/AIDS ²		Percentage who know that HIV/AIDS can be transmitted from a mother to her baby		Number

Note: Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. Total includes women/men with no schooling or less than 8 years of schooling, women/men who are widowed/divorced/separated/deserted, women/men belonging to Muslim or other religions, and women/men belonging to scheduled caste or who don't know their caste/tribe, who are not shown separately.

¹ Partner who has no other partners

² Comprehensive knowledge means knowing that consistent use of a condom every time they have sex and having just one uninfected faithful sex partner can reduce the chance of getting HIV/AIDS, knowing that a healthy-looking person can have HIV/AIDS, and rejecting two common misconceptions about transmission or prevention of HIV/AIDS.

³ For women, visits to parental/in-laws' home excluded

⁴ Not belonging to scheduled caste, scheduled tribe, or other backward class

Table 83.1 Accepting attitudes toward those living with HIV/AIDS: Women

Among women age 15-49 who have heard of HIV or AIDS, percentage expressing specific accepting attitudes toward people with HIV/AIDS, by background characteristic, Goa, 2019-21

Background characteristic	Percentage of women who:									
	Are willing to care for a relative with HIV/AIDS in own home	Would buy fresh vegetables from a shopkeeper or vendor who has HIV/AIDS	Say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching	Would not want to keep secret that a family member got infected with HIV/AIDS	Would allow an HIV positive student to attend school with students who are HIV negative	Think that people living with HIV/AIDS should be treated in the same public hospital as persons who are HIV negative	Think that people living with HIV should be allowed to work in the same office with people who are HIV negative	Express accepting attitudes on all seven indicators	Number of women who have heard of HIV or AIDS

Total	6.3	6.7	4.6	8.3	9.7	157

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women. Figures in parentheses are based on 25-49 unweighted cases. Total includes women whose husband has no schooling or has less than 10 years of schooling, women whose husband drinks alcohol but never gets drunk or gets drunk often, women who are older than their husband or are of the same age or are 10 or more years younger, women who have not attended school and whose husband has not attended school, women whose husband displayed 3-6 marital control behaviours, women who gave 7 reasons that wife beating is justified, and women who are afraid of their husband most of the time, who are not shown separately.

¹ Currently married women only

² Behaviours include: Is jealous or angry if she talks to other men, frequently accuses her of being unfaithful, does not permit her to meet her female friends, tries to limit her contact with her family, insists on knowing where she is at all times, and does not trust her with any money

³ Reasons given for which wife beating is justified include: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn't cook properly, he suspects she is unfaithful, and she shows disrespect for in-laws

Table 110 Help seeking

Percentage of women age 18-49 who have ever experienced physical or sexual violence by whether they have ever sought help, Goa, 2019-21

Help seeking	Total
Never sought help and never told anyone	(75.7)
Never sought help but told someone	(14.7)
Sought help	(9.6)
Number of women who experienced violence	43

Note: Figures in parentheses are based on 25-49 unweighted cases.

APPENDIX

ESTIMATES OF SAMPLING ERRORS

The estimates from a sample survey are affected by two types of errors: (1) non-sampling errors, and (2) sampling errors. Non-sampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the fifth National Family Health Survey (NFHS-5) to minimize this type of error, non-sampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-5 is only one of many samples that could have been selected from the same population, using the same design and expected sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the standard error for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS-5 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-5 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as total fertility rates and child mortality rates.

The Taylor linearization method treats any proportion or mean as a ratio estimate, $r = y/x$, where y represents the total sample value for variable y , and x represents the total number of cases in the group or subgroup under consideration. The variance of r is computed using the formula given below, with the standard error being the square root of the variance:

$$SE^2(r) = var(r) = \frac{1-f}{x^2} \sum_{h=1}^H \left[\frac{m_h}{m_h - 1} \left(\sum_{i=1}^{m_h} z_{hi}^2 - \frac{z_h^2}{m_h} \right) \right]$$

in which

$$z_{hi} = y_{hi} - rx_{hi}, \text{ and } z_h = y_h - rx_h$$

where h represents the stratum, which varies from 1 to H ,
 m_h is the total number of clusters selected in the h^{th} stratum,
 y_{hi} is the sum of the weighted values of variable y in the i^{th} cluster in the h^{th} stratum,
 x_{hi} is the sum of the weighted number of cases in the i^{th} cluster in the h^{th} stratum, and
 f is the overall sampling fraction, which is so small that it is ignored.

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers all but one cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the NFHS-5 sample for Goa, there were 84 clusters. Hence, 84 replications were created. The variance of a rate r is calculated as follows:

$$SE^2(r) = var(r) = \frac{1}{k(k-1)} \sum_{i=1}^k (r_i - r)^2$$

in which

$$r_i = kr - (k-1)r_{(i)}$$

where r is the estimate computed from the full sample of 84 clusters,
 $r_{(i)}$ is the estimate computed from the reduced sample of 83 clusters (i^{th} cluster excluded), and
 k is the total number of clusters.

In addition to the standard error, the design effect (DEFT) for each estimate is computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. The relative standard error (SE/R) and confidence limits ($R \pm 2SE$) for each estimate are also computed.

Sampling errors for NFHS-5 are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for Goa as a whole. For each variable, the type of statistic (mean, proportion, rate, or ratio) and the base population are given in Table A.1. Table A.2 presents the total values of the statistic (R), their standard errors (SE), the number of unweighted (N) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits ($R \pm 2SE$) for each variable. The DEFT is considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1).

Table A.1 List of variables for sampling errors, Goa, 2019-21

Variable	Estimate	Base population
HOUSEHOLDS		
Using an improved source of drinking water	Proportion	Households
Using an improved sanitation facility	Proportion	Households
Using iodized salt	Proportion	Households
Sex ratio (females per 1,000 males)	Ratio	<i>De facto</i> household population, all ages
WOMEN		
No schooling (Females age 6 years and above)	Proportion	<i>De facto</i> household population of females age 6 and above
Urban residence	Proportion	Women age 15-49
No schooling (Women age 15-49)	Proportion	Women age 15-49
Completed 10 or more years of schooling	Proportion	Women age 15-49
Never married, including married <i>gauna</i> not performed	Proportion	Women age 15-49
Currently married	Proportion	Women age 15-49
Married before age 18	Proportion	Women age 20-49
Currently using any contraceptive method	Proportion	Currently married women age 15-49
Currently using a modern contraceptive method	Proportion	Currently married women age 15-49
Currently using a traditional contraceptive method	Proportion	Currently married women age 15-49
Currently using pill	Proportion	Currently married women age 15-49
Currently using IUD/PPIUD	Proportion	Currently married women age 15-49
Currently using condom/ <i>Nirodh</i>	Proportion	Currently married women age 15-49
Currently using female sterilization	Proportion	Currently married women age 15-49
Using public health sector source of contraception	Proportion	Women age 15-49 currently using modern methods of contraception
Unmet need for family planning	Proportion	Currently married women age 15-49
Want no more children	Proportion	Currently married women age 15-49
Want to delay next birth at least 2 years	Proportion	Currently married women age 15-49
Mother received four or more antenatal care (ANC) visits	Proportion	Women with at least one birth in last five years (last birth)
Took iron and folic acid (IFA) for 100 days or more	Proportion	Women with at least one birth in last five years (last birth)
Birth registration	Proportion	<i>De jure</i> children under age 5 years
Births delivered by a skilled provider	Proportion	Births in last 5 years
Institutional delivery	Proportion	Births in last 5 years
Postnatal check for mother within 2 days of birth	Proportion	Women with at least one birth in last five years (last birth)
Postnatal check for newborn within 2 days of birth	Proportion	Women with at least one birth in last five years (last birth)
Exclusive breastfeeding	Proportion	Children under age 6 months
Children with diarrhoea in the last two weeks	Proportion	Children under age 5 years
Treated with oral rehydration salt (ORS) packets	Proportion	Children under age 5 years with diarrhoea in last 2 weeks
Children with diarrhoea taken to a health provider	Proportion	Children under age 5 years with diarrhoea in last 2 weeks
Child received BCG vaccination	Proportion	Children age 12-23 months
Child received penta or DPT vaccination (3 doses)	Proportion	Children age 12-23 months
Child received polio vaccination (3 doses)	Proportion	Children age 12-23 months
Child received first dose of measles vaccine	Proportion	Children age 12-23 months
Child received penta or hepatitis B vaccination (3 doses)	Proportion	Children age 12-23 months
Child with all basic vaccinations	Proportion	Children age 12-23 months
Height-for-age, stunting (below -2SD)	Proportion	Children under age 5 years who were measured
Weight-for-height, wasting (below -2SD)	Proportion	Children under age 5 years who were measured
Weight-for-age, underweight (below -2SD)	Proportion	Children under age 5 years who were measured
Children with any anaemia	Proportion	Children age 6-59 months with an anaemia test
Women with any anaemia	Proportion	Women age 15-49 with an anaemia test
Body mass index (BMI) <18.5 kg/m ²	Proportion	Women age 15-49 who were measured
Body mass index (BMI) ≥25.0 kg/m ²	Proportion	Women age 15-49 who were measured
Waist-to-hip ratio ≥0.85	Proportion	Women age 15-49 who were measured
Have heard of HIV or AIDS	Proportion	Women age 15-49
Have comprehensive knowledge about HIV/AIDS	Proportion	Women age 15-49
Ever experienced physical or sexual violence	Proportion	Women age 15-49
Total fertility rate (last 3 years)	Rate	Women
Neonatal mortality	Rate	Births in last 5 years
Postneonatal mortality	Rate	Births in last 5 years
Infant mortality	Rate	Births in last 5 years
Child mortality	Rate	Births in last 5 years
Under-five mortality	Rate	Births in last 5 years
MEN		
No schooling (Males age 6 years and above)	Proportion	<i>De facto</i> household population of males age 6 and above
Urban residence	Proportion	Men age 15-49
No schooling (Men age 15-49)	Proportion	Men age 15-49
Completed 10 or more years of schooling	Proportion	Men age 15-49
Never married, including married <i>gauna</i> not performed	Proportion	Men age 15-49
Currently married	Proportion	Men age 15-49
Married before age 21	Proportion	Men age 25-49
Want no more children	Proportion	Currently married men age 15-49
Want to delay next birth at least 2 years	Proportion	Currently married men age 15-49
Men with any anaemia	Proportion	Men age 15-49 with an anaemia test
Body mass index (BMI) <18.5 kg/m ²	Proportion	Men age 15-49 who were measured
Body mass index (BMI) ≥25.0 kg/m ²	Proportion	Men age 15-49 who were measured
Waist-to-hip ratio ≥0.90	Proportion	Men age 15-49 who were measured
Have heard of HIV or AIDS	Proportion	Men age 15-49
Have comprehensive knowledge about HIV/AIDS	Proportion	Men age 15-49
