INTRODUCTION

The 2019-21 National Family Health Survey (NFHS-5), the fifth in the NFHS series, provides information on population, health, and nutrition for India and each state and union territory. Like NFHS-4, NFHS-5 also provides district-level estimates for many important indicators. All five NFHS surveys have been conducted under the stewardship of the Ministry of Health and Family Welfare (MoHFW), Government of India. MoHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-5 was provided by the Government of India. Technical assistance and additional funding for NFHS-5 was provided by the USAID-supported Demographic and Health Surveys Program, ICF, USA. Assistance for some of the Clinical, Anthropometric, and Biochemical (CAB) tests was provided by the ICMR and the National AIDS Research Institute (NARI), Pune.

Four survey questionnaires—household, woman’s, man’s, and biomarker—were used to collect information in 19 languages using Computer Assisted Personal Interviewing (CAPI). All women age 15-49 and men age 15-54 in the selected sample households were eligible for interviewing. In the household questionnaire, basic information was collected on all usual members of the household and visitors who stayed in the household the previous night, as well as socioeconomic characteristics of the household, water and sanitation, health insurance, and number of deaths in the household in the three years preceding the survey. Two versions of the woman’s questionnaire were used in NFHS-5. The first version (district module), which collected information on women’s characteristics, marriage, fertility, contraception, reproductive health, children’s immunizations, treatment of childhood illnesses, and nutrition was fielded in the entire sample of NFHS-5 households. Information on these topics is available at the district, state, and national levels. In the second version of the questionnaire (state module), four additional topics, namely, sexual behaviour, HIV/AIDS, husband’s background and women’s work, and domestic violence, were also included. This version was fielded in a subsample of NFHS-5 households designed to provide information only at the state and national levels. The man’s questionnaire covered the man’s characteristics, marriage, number of children, contraception, fertility preferences, nutrition, sexual behaviour, attitudes towards gender roles, HIV/AIDS, and lifestyle. The biomarker questionnaire covered measurements of height, weight, and haemoglobin levels for children; height, weight, waist and hip circumference, haemoglobin levels, and finger-stick blood for additional CAB testing in a laboratory for women age 15-49 and men age 15-54; and blood pressure and random blood glucose for women and men age 15 years and over. Questionnaire information and biomarkers were collected only with informed consent from the respondents.

The NFHS-5 sample was designed to provide estimates of all key indicators at the national and state levels, as well as estimates for most key indicators at the district level (for all 707 districts in India, as on 31 March, 2017). The total sample size of approximately 610,000 households for India was based on the size needed to produce reliable indicator estimates for each district. The rural sample was selected through a two-stage sample design with villages as the Primary Sampling Units (PSUs) at the first stage (selected with probability proportional to size), followed by a random selection of 22 households in each PSU at the second stage. In urban areas, there was also a two-stage sample design with Census Enumeration Blocks (CEB)

selected at the first stage and a random selection of 22 households in each CEB at the second stage. At the second stage in both urban and rural areas, households were selected after conducting a complete mapping and household listing operation in the selected first-stage units.

Readers should be cautious while interpreting and comparing the trends as some States/UTs may have a smaller sample size. Moreover, at the time of survey, *Ayushman Bharat AB-PMJAY* and *Pradhan Mantri Surakshit Matritva Abhiyan (PMSMA)* were not fully rolled out and hence, their coverage may not have been factored in the results of the percentage of households with any usual member covered under a health insurance/financing scheme and the percentage of mothers who received 4 or more antenatal care visits, respectively. Hence, the results should be interpreted with caution.

NFHS-5 fieldwork for Telangana was conducted in all 31 districts of the state from 30 June, 2019 to 14 November, 2019 by Karvy Data Management Services Ltd. Information was collected from 27,351 households, 27,518 women age 15-49 (including 4,159 women interviewed in PSUs in the state module), and 3,863 men age 15-54.

This report presents the key findings of the NFHS-5 survey in Telangana, followed by detailed tables and an appendix on sampling errors. At the time of finalization of this report, wealth quintiles for the country as a whole were not ready. Therefore, on finalization of the national report, the breakup of key indicators by wealth quintiles for all states will be provided as an additional document and uploaded on the official website of MoHFW and IIPS.

HOUSEHOLD CHARACTERISTICS

Important household characteristics includes household composition, housing characteristics, household possessions, access to a toilet facility, and education. The household characteristics reflect the environmental risk factors and behavioural outcomes of the household population, including their likely impact on health status.

Household composition

In Telangana, nearly one-third (65%) of the households are in rural areas. On average, households are comprised of 3.6 members. Nineteen percent of households are headed by women, with 15 percent of the population living in female-headed households.

Eighty-seven percent of households in Telangana have household heads who are Hindu. Ten percent of households have household heads who are Muslim and 3 percent of households have household heads who are Christian.

Twenty-three percent of households in Telangana have household heads who belong to a scheduled caste, 8 percent belong to a scheduled tribe, and 57 percent belong to an other backward class. Eleven percent of household heads do not belong to a scheduled caste, a scheduled tribe, or an other backward class. The majority of households (68%) are nuclear, and 44 percent of the population reside in non-nuclear households.

Nearly a quarter (23%) of Telangana's population is under age 15; only 8 percent is age 65 and over. The overall sex ratio of the population is 1,049 females per 1,000 males, and the sex ratio of the population under 7 years of age is low lower at 917 females per 1,000 males. Ninety-six percent of persons have an *Aadhaar* card.

Among children below 18 years of age, 6 percent have experienced the death of one or both parents. In all, 87 percent of children below 18 years of age live with both parents, 11 percent live with one parent (mostly with their mother), and the remaining 2 percent live with neither parent. Births of almost all children (90%) under 5 years of age were registered with the civil authorities, and 75 percent of children have a birth certificate.

Death registration

Seventy-four percent of deaths of usual household members in the three years preceding the survey were registered with the civil authorities (64% of deaths at age 0-4, 79% of deaths at age 25-34, and 75% of deaths at age 35 and above).

The distribution of death registration by religion shows that 73 percent of deaths were registered among Hindus, 76 percent among Muslims and 86 percent among Christian. Seventy-three percent of deaths are registered among other backward classes, over three-quarters (76%) among scheduled castes, and 68 percent among scheduled tribes. Overall in Telangana, death registration is higher in urban (79%) than rural areas (71%) and among males (80%) than females (66%).

Disability

The respondent to the Household Questionnaire provided information for all usual household members on whether or not they have any disability in specified domains. The domains of disability are hearing, speech, visual, mental, locomotor, and other. Just over 1 percent of (1.1%) of the de jure household population has any disability. The most prominent type of disability is locomotor (0.4%). Men are slightly more likely than women to have any disability (1.2% men compared with 0.9% women). The proportion of household members who have any disability rises with increasing age. For instance, 2 percent of the household members age 70 and above are reported to have any disability, compared with about 1 percent of household members in the younger age groups.

Housing characteristics

Nearly one-fifth (79%) of households in Telangana live in a *pucca* house and almost all (99%) households have electricity.

Ninety-seven percent of households in Telangana have basic drinking water service, and 99 percent of households use an improved source of drinking water, but only 37 percent have water piped into their dwelling, yard, or plot. Urban households (52%) are more likely than rural households (29%) to have water piped into their dwelling, yard, or plot. Sixteen percent of households use an appropriate treatment method to make drinking water potable (mostly by straining water through cloth). A large majority of households (92%) in Telangana use a clean fuel for cooking.

Nearly two-fifths (37%) of households in Telangana have water piped into their dwelling, yard, or plot.

Access to toilet facility

Sanitation is one of the foundations of a healthy, comfortable, and dignified life. Households without proper sanitation facilities have a greater risk of diseases like diarrhoea, dysentery, and typhoid than households with improved sanitation facilities that are not shared with other households.

In Telangana, thirteen percent of all households and 18 percent of rural households do not use any sanitation facility; they use open spaces or fields. Eighty-eight percent of households have access to a toilet facility, with a much higher accessibility in urban areas (97%) than in rural areas (83%). Access to a toilet facility ranges from 71 percent among scheduled tribe households to 97 percent among households which are not scheduled castes, scheduled tribes or other backward class households. Access to toilet facility varies widely across the districts, ranging from 64 percent in Komaram Bheem Asifabad district to 100 percent in Hyderabad district. More than 99 percent of urban households have access to a toilet facility in seven districts (Hyderabad, Jangoan, Khammam, Medchal-Malkajgiri, Rajanna Sircilla, Ranga Reddy and Siddipet).

Selected household possessions

In Telangana, 69 percent of households own a house (74% of rural households and 60% of urban households). Almost all urban households (96%) and most rural households (91%) in Telangana have a mobile phone. Ninety-seven percent of households have a bank or post office account. Fifty-five percent of households own either a motorcycle or a scooter. BPL cards are held by 85 percent of households. Irrigated land is owned by 45 percent of rural households and 11 percent of urban households. Overall, 45 percent of all households in Telangana own agricultural land, and 27 percent of households own farm animals.

Background characteristics of respondents

Twenty-seven percent of women and 30 percent of men are in the 15-24 age group, while 31 percent of women and men each are in the 25-34 age group. Sixty-three percent of women and 60 percent men are in rural areas.

In NFHS-5, literate persons are those who have either completed at least standard 9 or passed a simple literacy test conducted as part of the survey. According to this measure, 65 percent of women age 15-49 and 82 percent of men age 15-49 are literate.

Thirty-three percent of women and 15 percent of men age 15-49 have never been to school. Only 27 percent of women age 15-49 in Telangana have completed 12 or more years of schooling, compared with 38 percent of men.

Media exposure is quite widespread among women and men in Telangana. More than three-quarter (75%) of men and same proportion of women watch television at least once a week. However, men (42%) are much more likely than women (17%) to read a newspaper or magazine at least once a week. Twelve percent of men and 20 percent of women are not regularly exposed to print media or other forms of media.

Women are more likely than men to be currently married (74% versus 62%) or widowed (6% versus 0.2%), while men are more likely than women to be never married (18% versus 38%).

A majority of female respondents are Hindus (86%), while 11 percent are Muslims, and 3 percent are Christians.

Fifty-eight percent of female respondents belong to an other backward class, while 22 percent belong to a scheduled caste. Nine percent of women and 7 percent of men belong to a scheduled tribe, while 10 percent of both men and women 15-49 do not belong to either scheduled caste or scheduled tribe or other backward class.

Fifty-two percent of women and 20 percent of men age 15-49 were not employed in the 12 months preceding the survey. Three percent of women and 29 percent of men were engaged in an agricultural occupation, while 44 percent of women and 48 percent of men were employed in a non-agricultural occupation.

EDUCATION

In NFHS-5, information related to pre-school attendance has been collected for the first time, in addition to school attendance among children age 6-17 years and educational attainment of other members of the household, including reasons for drop-out in the case of those who discontinued education.

Preschool attendance

In India, many children attend *anganwadi* centres that provide spaces for children to learn, play, eat nutritious food, and develop the skills needed for a lifetime of learning. Attending pre-primary education, such as at an *anganwadi* centre, improves children's school readiness by providing quality learning through interactive play methods with qualified instructors. Also, parents or guardians can go to work at ease if children are enrolled in pre-primary education.

In Telangana, 60 percent of boys and 64 percent of girls age 2-4 years attend preschool. Preschool attendance is lower among children in nuclear households (61%) than children in non-nuclear households (63%). Preschool attendance is higher among children in households headed by Hindus (65%) or Christian (54%) than household headed by Muslims (51%). Preschool attendance is highest among scheduled tribe and other backward class households (64% each), slightly lower among scheduled caste households (61%), and lowest in households not belonging to a scheduled caste, scheduled tribe or other backward class. Preschool attendance is higher in households with 3-5 members (64%), compared with households with 6 or more members (60%). Overall, urban households (59%) show lower preschool attendance than rural households (65%). Preschool attendance is highest in Khammam district (76%) and lowest in Jogulamba Gadwal district (49%).

School attendance among children

Ninety-three percent of children age 6-17 years in Telangana attend school (94% in urban areas and 93% in rural areas). School attendance is almost universal (97%) at age 6-14 years, but drops sharply to 80 percent at age 15-17 years. Gender disparity in school attendance in the 6-14 year age group does appear in Telangana; however, in the age group 15-17 years, 79 percent of girls compared with 81 percent of boys are attending school.

Are there gender differentials in children's school attendance?

Percentage of children attending school by age

FERTILITY

This section provides trends in the total fertility rate, age at marriage, pregnancy outcomes, teenage pregnancy, birth interval, the desire for more children, and son preference. NFHS-5 estimates on the median age at marriage, total fertility rate, and teenage motherhood illustrated in this section can help in setting benchmarks for the Sustainable Development Goals at the sub-national level.

Age at first marriage

In Telangana, the median age at first marriage is 19.3 years among women age 25-29 years and 18.3 years among women age 20-49 years. Only 9 percent of women age 20-49 years have never married, compared with 27 percent of men age 20-49 years. Less than one-quarter (24%) of women age 20-24 years got married before attaining the legal minimum age of 18 years, down from 26 percent in NFHS-4. Thirty-six percent of women age 20-24 years are never married, compared with 85 percent of men in the same age group, showing that the age at marriage is much lower for women than men in Telangana.

Fertility levels

The total fertility rate (TFR) in Telangana is 1.8 children per woman, which is well below the replacement level of fertility.

The total fertility rate in urban areas, at 1.8 children per woman, and in rural areas, at 1.7 children per woman, are both below the replacement level. Among births in the three years preceding the survey, 3 percent were of birth order four or higher, compared with 4 percent in NFHS-4.

The greatest differentials in fertility are by religion, caste/tribe, and schooling. At current fertility rates, women with no schooling will have an average of 0.1 more children than women with 12 or more years of schooling. Muslim women will have an average of 0.3 children more than Hindu women (a TFR of 2.0, compared with 1.7) and 0.3 children more than Christian (1.8).

Fertility Trends

*Total fertility rate
(children per woman)*

How does fertility vary with schooling?

Total fertility rate (children per woman)

Pregnancy outcome

Ninety-one percent of last pregnancies in the five years preceding the survey ended in a live birth, and the remaining 9 percent terminated in foetal wastage (abortion, miscarriage, or stillbirth). Miscarriage is the most commonly reported type of foetal wastage, accounting for 5 percent of all pregnancies, and abortions accounted for 4 percent.

The two main reasons for seeking abortion reported by women were health did not permit (27%) unplanned pregnancy (18%) and complications in pregnancy (18%). The most common methods used for performing abortions were medicines (59%), manual vacuum aspiration (MVA) (12%), and other surgical methods (19%). A large majority (79%) of abortions were performed in the private health sector and 15 percent were performed in the public health sector. Eleven percent of women reporting an abortion reported having complications from the abortion. Most abortions in Telangana (89%) are performed by a doctor.

Teenage pregnancy

Among young women age 15-19 in Telangana, 6 percent have already begun childbearing, that is, they have already had a live birth or are pregnant with their first child, which is the 11 percent as in NFHS-4. The proportion of women who have started childbearing rises sharply from 2 percent at age 17 years to 6 percent among women age 18 years and to 18 percent among women age 19 years. The proportion who have started childbearing is much higher among young women who had no schooling (23%) than those with 12 or more years of schooling (6%).

Birth intervals

The median interval between births in the five years before the survey in Telangana is 30 months. Thirteen percent of births take place within 18 months of the previous birth and 33 percent occur within 24 months. The proportion of births occurring within 24 months of a previous birth is particularly high for mothers in the 20-29 age group (38%) and for births occurring after a deceased sibling (45%). Sixty-three of all births occur within three years of the previous birth. Research shows that waiting at least three years between children reduces the risk of infant mortality and has a positive impact on maternal health.

More than three-fifths (63%) of births in Telangana occur within three years of the previous birth.

Fertility preferences

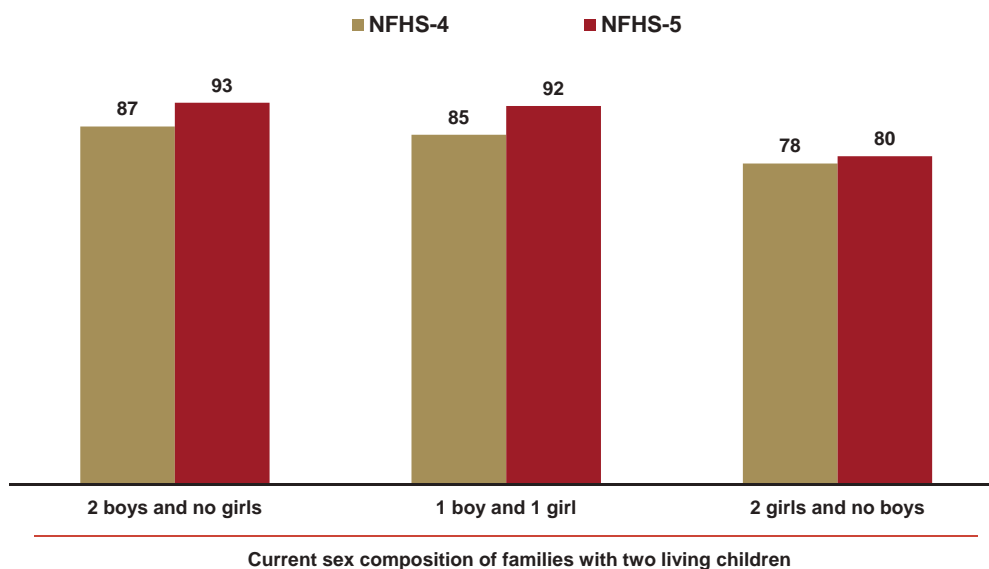

Seventy-five percent of currently married women and 74 percent of men age 15-49 years want no more children, are already sterilized, or have a spouse who is sterilized. Among those who want another child, 23 percent of women and 37 percent of men would like to wait at least two years before the next birth. Eighty-four percent of women and 81 percent of men consider the ideal family size to be two or fewer children.

In Telangana, there is a strong preference for sons. Eleven percent of women and 14 percent of men want more sons than daughters, but only 4-6 percent of women and men want more daughters than sons. However, 82 percent of men and 85 percent women would like to have at least one son and about 80 percent men and 83 percent women want at least one daughter.

Women's desire for more children is strongly affected by their current number of sons. For example, among women with two children, 93 percent with 1-2 sons want no more children, compared with 80 percent with two daughters who want no more children. Notably, the proportion of currently married women and men with two children who want no more children irrespective of their number of sons has increased respectively 6 percentage points and 2 percentage points in the 4 years since NFHS-4.

How does son preference affect women's desire for children?

Percentage of currently married women with two children who want no more children

In Telangana, unplanned pregnancies are fairly common. If all women were to have only the number of children they wanted, the total fertility rate would have been 1.6 children per woman, instead of the current level of 1.8 children per woman.

FAMILY PLANNING

The family planning section covers trends in contraceptive knowledge and current use, informed choice, and unmet need for family planning methods among women age 15-49 years. It also includes information on men’s attitude towards women using a contraceptive method. As in previous rounds of the survey, NFHS-5 provides estimates of the contraceptive prevalence rate and unmet need for family planning.

Contraceptive knowledge and use

Knowledge of contraception is almost universal in Telangana. However, some methods are still less well known. Only half of currently married women know about the lactational amenorrhoea method (LAM) and 17 percent know about female condoms. Among all women, only 42 percent know about emergency contraception.

The contraceptive prevalence rate (CPR) among currently married women age 15-49 is 68 percent, only a slight increase from NFHS-4 (57%). The use of modern family planning methods (67%) has also increased slightly from its level in NFHS-4 (57%). The use of female sterilization has increased from 54 percent to 62 percent between NFHS-4 and NFHS-5; whereas the share of female sterilization in overall contraceptive use has declined from 95 in NFHS-4 to 91 percent in NFHS-5 surveys. Contraceptive use in NFHS-5 increases sharply with age, from 9 percent for women age 15-19 to 83 percent for women age 40-49.

In Telangana, contraceptive use shows little difference in rural and urban areas. Contraceptive prevalence decreases with increasing schooling of women. Seventy-five percent of currently married women with no schooling use female sterilization, compared with only 40 percent of women with 12 or more years of schooling. Muslim women (65%) are less likely to use contraception than either Hindu (69%) or Christian (67%).

Women in Telangana are much more likely to use contraception if they already have a son. For example, among women with two children, 83 percent with at least one son use a method of family planning, compared with 74 percent of women with two daughters and no sons.

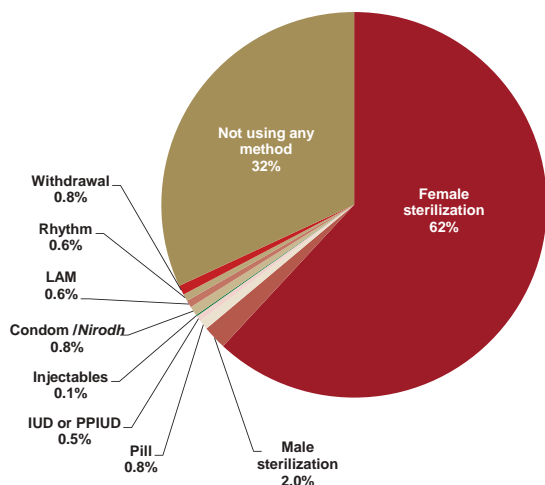

How many women use family planning?

Percentage of currently married women

What contraceptive methods do women use?

Currently married women

The most common modern spacing methods used by currently married women in Telangana are condoms/*Nirodh* (0.8%) and pill (0.8%), followed by the IUD or PPIUD (0.5%). In general, urban women and better-educated women are more likely than other women to use spacing methods.

Sixty-Seven percent of sterilized women had their sterilization operation in the public sector, mainly in a government or municipal hospital, and 63 percent of IUD or PPIUD users had their IUD insertion in the private sector.

The majority of pill and condom/*Nirodh* users get their supply from the private health sector or other source, including a shop. Nonetheless, 41 percent of pill users and 48 percent of condom/*Nirodh* users get their supply from the public sector.

The 12-month discontinuation rate for any reason is 22 percent for all contraceptive methods. Sixty-four percent of users of modern spacing methods discontinued use within the first year after they adopted the method. The most common reason for discontinuation is the desire to become pregnant.

Sixty-four percent of users of modern spacing methods discontinued use within the first year after they adopted the method.

Informed choice

Women who know about all available contraceptive methods and their side effects can make better choices about what method to use. Only 61 percent of users of selected modern contraceptive methods were ever told by a health or family planning worker about other methods they could use. Only 49 percent were told about the possible side effects or problems with their method, and even fewer (45%) were told what to do if they experienced any side effects.

Men's attitudes

Almost 50 percent of men age 15-49 in Telangana agree that contraception is women's business and a man should not have to worry about it. However, only 35 percent of men think that women using contraception may become promiscuous. Half of men (50%) know that a condom, if used correctly, protects against pregnancy most of the time.

Contraceptive Prevalence Rate by District

Percentage of currently married women

Unmet need

Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop childbearing entirely, but are not using contraception. According to this definition, 6 percent of currently married women have an unmet need for family planning, slightly declined (7%) since NFHS-4. Currently, 91 percent of the demand for family planning is being satisfied and 89 percent of the demand is being satisfied by modern methods.

INFANT AND CHILD MORTALITY

The mortality rates among children under age 5 years including neonatal, postneonatal and infant mortality rates is an important indicator that measures the overall well-being of a country. The infant mortality rate in Telangana in NFHS-5 is estimated to be 26 deaths before the age of one year per 1,000 live births, down from the NFHS-4 estimate of 30. The under-five mortality rate (U5MR) is estimated to be 29 deaths before five years of age per 1,000 live births, which has reduced from NFHS-4 (34 per 1,000).

Trends in Infant Mortality

Deaths per 1,000 live births

As expected, boys generally have lower mortality rates than girls, especially during the postneonatal period. Girls have a slightly higher mortality rate than boys during the neonatal period (in the first month after birth).

High-risk births have higher mortality rates

Deaths in the first year of life per 1,000 live births

Note: Categories "Mother's age at birth 40-49" and "birth order 4 or more" are not shown since there are fewer than 250 unweighted person-years of exposure to the risk of death

Children born to mothers under age 20 are more likely to die during infancy than children born to mothers in the prime childbearing age (20-29 years). Infant mortality is 27 per 1,000 live births for teenage mothers and 28 per 1,000 live births for mothers age 30-39, compared with 26 per 1,000 live births for mothers age 20-29. Infant mortality rates are also higher for Hindus than for Muslims and are highest for scheduled tribes. The infant mortality rate, based on the last five years births, has declined in rural but gone up in urban areas since NFHS-4 to NFHS-5. The infant mortality rate is higher for children whose mothers have less than 10 years of schooling than for mothers who have more than 10 years of schooling or no schooling at all.

Children born to the teenage mothers are more likely to die during infancy than to mothers age 20-29.

MATERNAL HEALTH

Maternal health is an important aspect for the development of any country in terms of increasing equity and reducing poverty. The survival and well-being of mothers are not only important in their own right, but are also central to solving broader economic, social, and developmental challenges. Maternal health care services are essential for the health and wellbeing of mothers, as well as their children, affecting the overall population and its health and nutritional status. This section describes the utilization of antenatal care, delivery care, and postnatal care by women who reported their last births in the five years preceding the survey. It also shows the extent of male involvement in maternal health care.

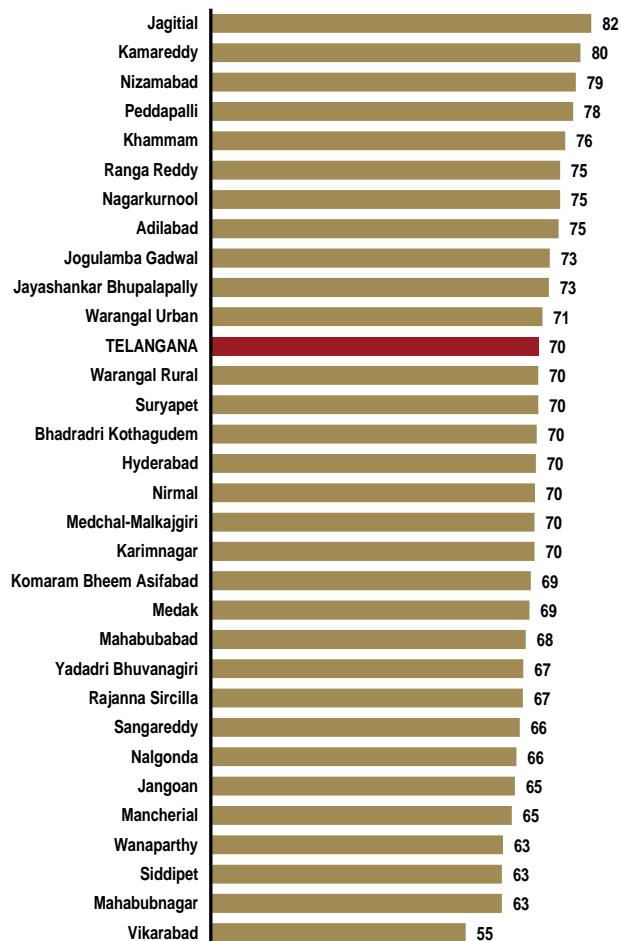

Antenatal care

Among mothers who gave birth in the five years preceding the survey, more than 9 in 10 received antenatal care for their last birth from a health professional (94% from a doctor and 4 percent from an auxiliary nurse midwife (ANM), lady health visitor (LHV), nurse, or midwife). Less than one percent did not receive any antenatal care (ANC). Among mothers who gave birth in the five years preceding the survey, 94 percent registered the pregnancy for the most recent live birth. Among the registered pregnancies, 97 percent received a Mother and Child Protection Card (MCP Card).

Eighty-nine percent of women received antenatal care during the first trimester of pregnancy, as is recommended. Seventy percent of mothers had four or more antenatal care visits. Urban women were more likely to have four or more antenatal care visits than rural women.

Four or More Antenatal Care Visits by District

Percentage of last births in the past five years

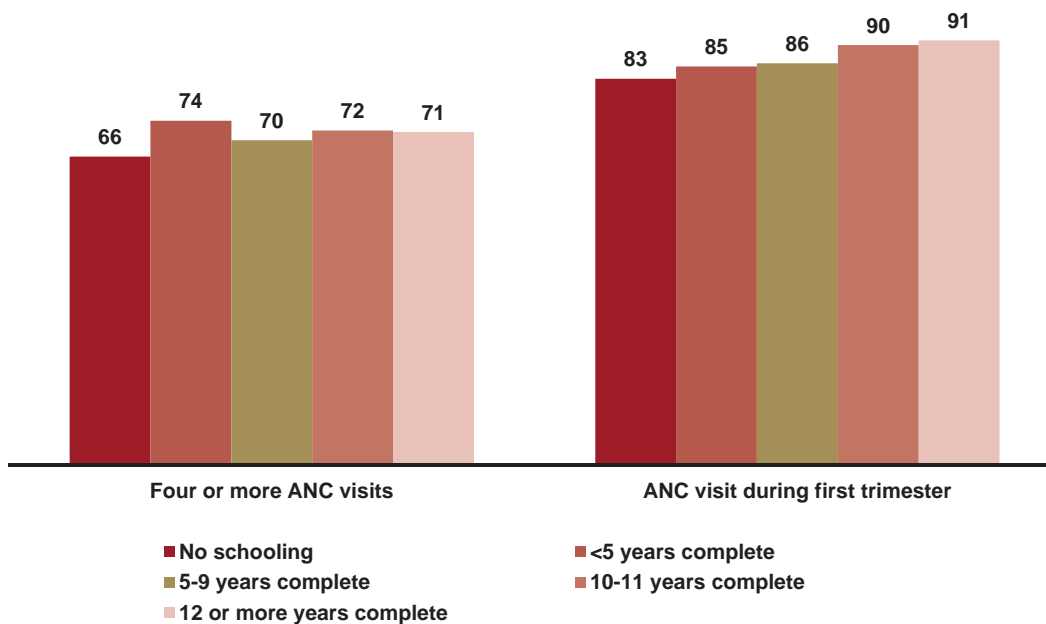

Since NFHS-4, there has been an increase in the percentage of mothers who had an antenatal check in the first trimester (from 83% to 89%) and a slight drop in the proportion of women who had four or more antenatal care visits (from 75% to 70%). For 91 percent of their last births, mothers received iron and folic acid (IFA) supplements, but only 58 percent consumed them for the recommended 100 days or more and only 34 percent consumed them for the newly recommended 180 days or more. Ninety percent of last births were protected against neonatal tetanus through tetanus toxoid vaccinations given to the mother. Twenty-three percent of mothers took an intestinal parasite drug during pregnancy.

Seventy percent of mothers in Telangana had at least four antenatal care visits for their last birth.

Among women with a live birth in the five years preceding the survey who met with a community health worker in the last three months of pregnancy for their most recent live birth, more than three-quarters received advice on each of five different areas (96% received advice on breastfeeding, 94% on keeping the baby warm, 91% on the importance of institutional delivery, 84% on cord care, and 79% on family planning).

How does appropriate antenatal care (ANC) vary with schooling?

Percentage of last births in the past five years

Even when women receive antenatal care, sometimes they do not receive all the services needed to monitor their pregnancy. In Telangana, almost all women who received antenatal care for their last birth received each of the services needed to monitor their pregnancy: having their weight taken (100%), their blood pressure measured (100%), having a urine sample taken (100%), having a blood sample taken (100%), and having their abdomen examined (98%).

An ultrasound test was performed during 94 percent of pregnancies in the five years preceding the survey. Women with less than 5 years of schooling were more likely to have an ultrasound test than women with no schooling. Pregnancies of women with no children at the time of pregnancy were more likely (95%) to have an ultrasound test than pregnancies of women with three living children (88%) at the time of pregnancy.

Delivery care

Ninety-seven percent of births take place in a health facility (mostly a government facility) and 3 percent take place at home. The percentage of births in a health facility increased in the 4 years, from 92 percent (NFHS-4) to 97 percent (NFHS-5). Institutional births are more common among women who have received an antenatal check, women with 12 or more years of schooling, women who are having their first birth, and urban women.

Are babies being delivered safely?

Percentage of births in the past five years

For 87 percent of home births, a clean blade was used to cut the cord, as is recommended. A disposable delivery kit was used for 49 percent of deliveries. Eighty-five percent of home births followed the recommendation that the baby should be immediately wiped dry and then wrapped without being bathed first.

Ninety-four percent of births during the past five years took place with assistance from a skilled provider, and another 1 percent were delivered by a traditional birth attendant.

Sixty-one percent of births during the past five years were delivered by caesarean section. Thirty-eight percent of caesarean sections (23% of all births) were emergency caesarean sections.

Ninety-seven percent of children in Telangana who were born in the past five years were born in a health facility.

Among women who had a live birth in the five years preceding the survey that was delivered in a health facility, 13 percent received financial assistance under *Janani Suraksha Yojana* (JSY). Rural women (15%) were more likely than urban women (11%) to receive financial assistance under JSY. Scheduled tribe women and scheduled caste women (17% each) were more likely than women from any other caste/tribe group to receive financial assistance under JSY.

Institutional Delivery by District

Percentage of births in the past five years

Postnatal care

Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. In Telangana, 92 percent of mothers had a postnatal check after their last birth and 88 percent of mothers had a postnatal check within two days of the birth, as is recommended. Postnatal care is most common for births in a health facility; 88 percent of births in public health facilities and 90 percent of private health facilities were followed by a postnatal check for the mother within two days of birth, compared with 54 percent of home births.

Ninety percent of last births in the five years preceding the survey received a health check in the first two days after birth. Thirty-five percent of home births received a health check in the first two days after birth.

Male involvement in maternal care

Ninety-three percent of men with a child under three years of age said that the youngest child's mother received antenatal care. Over three-quarters of men with a child under three years said they were present during at least one antenatal check received by the child's mother (69% in urban areas and 83% in rural areas), but only 55 percent were told by a health provider or health worker what to do if the mother had a pregnancy complication. Only 42-65 percent of men were told about the signs of specific pregnancy complications (convulsions, vaginal bleeding, prolonged labour, high blood pressure, and severe abdominal pain).

Most fathers with a child less than three years of age were given information about various aspects of maternal care. Seventy-nine percent of men were told about the importance of proper nutrition for the mother during pregnancy and 73 percent of the importance of delivering the baby in a health facility. Fifty-five percent of men were told by a health provider or a health worker about family planning or delaying the next child.

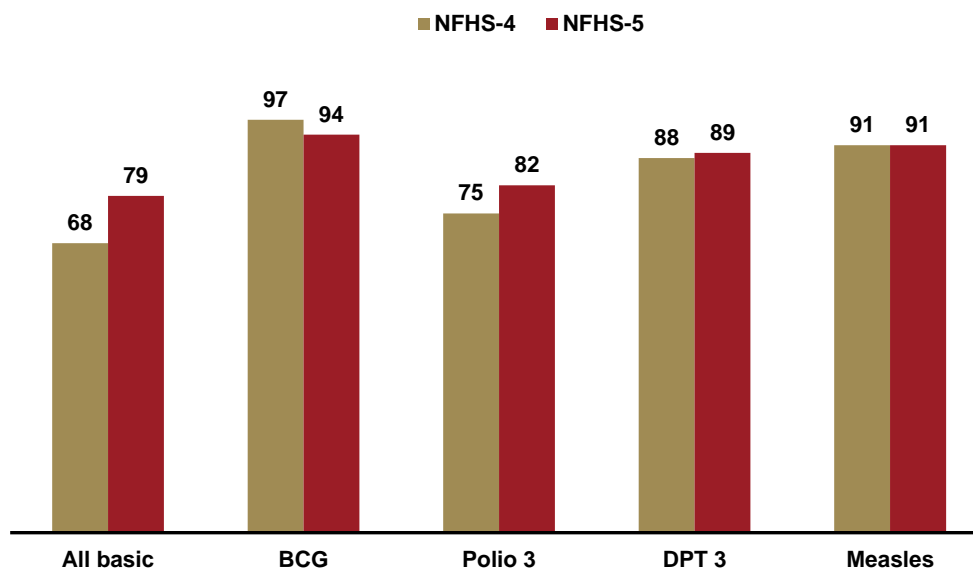

CHILD HEALTH

Vaccination of children

Vaccinations are considered as the most cost-effective intervention that can improve the overall health of children. Seventy-nine percent of children age 12-23 months received all basic vaccinations against six major childhood illnesses (tuberculosis, diphtheria, pertussis, tetanus, polio, and measles) at any time before the survey. However, 95 percent of children are at least partially vaccinated; only 5 percent have not received any vaccinations at all. Vaccinations were recorded from a vaccination card for a large majority (87%) of children, which is an improvement over since NFHS-4 (69%)

Trends in Vaccination Coverage

Percentage of children 12-23 months receiving vaccinations

Ninety-four percent of children have received a BCG vaccination. However, 82 percent have received the recommended three doses of polio vaccine, 89 percent have received the three recommended doses of DPT or Penta vaccine, and 91 percent have been vaccinated against measles. There is considerable dropout between the first and third doses of DPT vaccine (from 93% to 89%) and polio vaccine (from 91% to 82%). It should be noted that the Penta vaccine was not widely available at the time of the NFHS-4 survey.

Coverage of All Basic Vaccinations by District

Percentage of children 12-23 months

Between NFHS-4 and NFHS-5, there was a marginal increase in vaccination coverage for three doses of DPT (from 88% to 89%), decrease in BCG (from 97% to 94%), and measles remained unchanged (91%). The coverage for three doses of polio vaccine also increased, from 75 percent to 82 percent. Overall, there was an encouraging change in the coverage of all basic vaccinations (from 68% to 79%). In addition, 91 percent of children have received at least one dose of hepatitis B vaccine, and 86 percent of children have received all three recommended doses of hepatitis B vaccine.

Coverage with all basic vaccinations is higher for boys than girls (80% versus 79%) and for rural than urban areas (82% versus 75%). Coverage with all basic vaccinations is higher among children from Scheduled caste (84%) than children from any other caste/class group.

Childhood illnesses

In the two weeks before the survey, 2 percent of children under age five years had symptoms of an acute respiratory infection (cough accompanied by (1) short, rapid breathing that is chest related and/or (2) difficult breathing that is chest related). Of these children, 60 percent were taken to a health facility or health provider.

Nineteen percent of children under age five were reported to have had fever in the two weeks preceding the survey; 78 percent of these children were taken to a health facility or provider for treatment.

Overall, 7 percent of children under age five years had diarrhoea in the two weeks preceding the survey. Seventy-two percent of these children were taken to a health facility or health provider. Ninety-seven percent of mothers of young children have heard of oral rehydration salt (ORS) packets for the treatment of diarrhoea, but only 56 percent of children with diarrhoea were given ORS. Twenty-three percent of children with diarrhoea were given gruel and 62 percent were given any type of oral rehydration therapy (ORT). Thirty-nine percent were given zinc supplements. Seventeen percent of children with diarrhoea did not receive any type of treatment at all.

To reduce dehydration and minimise the effects of diarrhoea on nutritional status, it is recommended that normal feeding of children be continued when they have diarrhoea and that the amount of fluids given should be increased. However, in Telangana only 4 percent of children with diarrhoea received more to drink than normal. Only 32 percent of children received the same amount to drink as usual. Of greater concern, nearly two-thirds (65%) of children with diarrhoea were given less to drink or nothing at all to drink. Nearly one-third (32%) of children with diarrhoea were given the same amount of food or more food, as recommended.

Integrated Child Development Services (ICDS)

The ICDS programme provides nutrition and health services for children under age six years and pregnant or breastfeeding women, as well as preschool activities for children age 3-5 years. These services are provided through community-based *anganwadi* centres.

How many children received *anganwadi* center services?

Percentage of age-eligible children receiving services

Seventy-one percent of children under 6 years received services of some kind from an *anganwadi* centre in the 12 months preceding the survey. The most common services that age-eligible children receive are growth monitoring (71%), supplementary food (69%), health check-ups (64%), and immunizations (59%). The service that is least likely to be accessed is early childhood care or preschool (53%). Slightly more than four out of five (84%) mothers of children who were weighed at an *anganwadi* centre received counselling from an *anganwadi* worker or an ANM. Among children under 6 years, 81 percent of their mothers received any service from an *anganwadi* centre during pregnancy, and 80 percent of their mothers received any service while breastfeeding.

BREASTFEEDING, NUTRITION, AND ANAEMIA

Infant feeding

Although breastfeeding is nearly universal in Telangana, only 68 percent of children under 6 months are exclusively breastfed, as the World Health Organization (WHO) recommends. Eighty-eight percent are put to the breast within the first day of life, but only 38 percent started breastfeeding in the first hour of life (as recommended). While exclusive breastfeeding indicators show an improvement since NFHS-4, many infants are still deprived of the highly nutritious first milk (colostrum) and the antibodies it contains.

It is recommended that nothing be given to children other than breastmilk even in the first three days when the milk has not begun to flow regularly because prelacteal feeds limit the frequency of suckling by the infant and expose the baby to the risk of infection. However, 14 percent of children are given something other than breastmilk during the first three days, called prelacteal feed. Overall, 90 percent of children continue breastfeeding at 1 year and less than three quarter (72%) continue breastfeeding at 2 years. The median duration of breastfeeding is 26.8 months, which is the age to which half of children are breastfed.

After the first 6 months, breastmilk is no longer enough to meet the nutritional needs of infants. Therefore, complementary foods should be added to the diet of the child. However, at age 6-8 months, only half (50%) of children in Telangana receive breastmilk and complementary foods.

WHO has several recommendations for infant and young child feeding (IYCF) practices for children age 6-23 months. The key IYCF indicators measure the adequacy of dietary diversity and meal frequency for breastfed and non-breastfed children. Thirty-one percent of children age 6-23 months are fed the recommended minimum number of times per day and even one fourth are fed from the appropriate number of food groups. Only 9 percent are fed according to all three recommended practices.

Micronutrient deficiency is a major contributor to childhood morbidity and mortality. Vitamin A is an essential nutrient for the immune system. Severe vitamin A deficiency (VAD) can cause eye damage and a higher risk of dying from measles and diarrhoeal disease. The Government of India recommends that children under 5 years of age receive vitamin A supplements every six months, starting at age 9 months. In Telangana, more than two-thirds (72%) of children age 9-35 months were given a vitamin A supplement in the past six months, but only 43 percent of

children age 6-23 months living with their mother consumed vitamin A-rich foods during the day or night before the survey.

Iron deficiency is a primary cause of anaemia. Eating foods rich in iron and taking iron supplements can help prevent anaemia. Thirty-four percent of children age 6-23 months ate iron-rich foods during the day or night before the survey; however, 42 percent of children in the same age group were given iron supplements in the week before the survey.

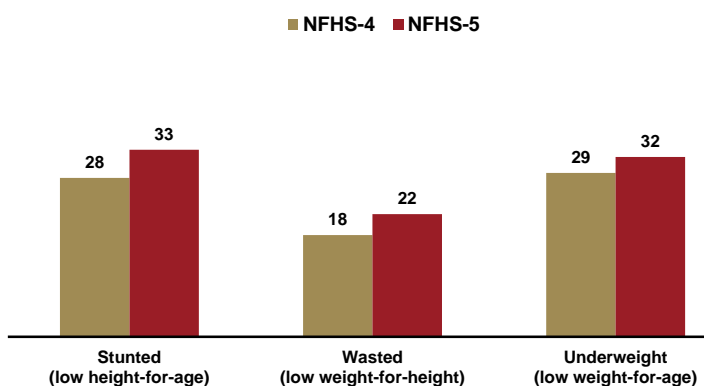

Children's nutritional status

Childhood undernutrition contributes to childhood diseases and is a major cause of child mortality in India. Thirty-three percent of children under age five years are stunted, or too short for their age, which indicates that they have been undernourished for some time. Twenty-two percent are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness causing weight loss, and 9 percent are severely wasted. Thirty-two percent are underweight, which takes into account both chronic and acute undernutrition. Even during the first six months of life when almost all babies are breastfed, 20 percent of children are stunted, 28 percent are wasted, and 24 percent are underweight.

Children's nutritional status in Telangana has substantially changed since NFHS-4 by all measures. The percentage of children who are stunted increased marginally from 28 percent to 33 percent in the 4 years between NFHS-4 and NFHS-5. The percentage of children who are underweight (28%) or wasted (18%) has increased respectively from 22 to 32 percent in between NFHS-4 to NFHS-5. However, the continuing high levels of undernutrition are still a major problem in Telangana.

Trends in Children's Nutritional Status

Percentage of children under five years

Note: Nutritional status estimates are based on the 2006 WHO International Reference Population

Differences in the levels of malnutrition are more pronounced for several background characteristics. Malnutrition generally decreases with increasing mother's schooling, better nutritional status of the mother, and larger child's size at birth. The level of undernutrition is relatively high for rural children and children of higher birth orders. It is generally higher among scheduled tribe children and lower among Muslim children than among children of any other religion. Malnutrition is somewhat higher for male children than female children on all three nutritional status measures.

Adults' nutritional status

Malnutrition refers to deficiencies, excesses, or imbalances in a person's intake of energy and/or nutrients, and includes undernutrition as well as overweight and obesity. The body mass index (BMI), which is defined as a person's weight in kilograms divided by the square of the person's height in metres, is a measure that indicates the nutritional status in adults.

The percentage of women and men are either too thin or overweight or obese have same (49%). Among women age 15-49, the proportion overweight or obese is 30 percent, which is 29 percent in NFHS-4. More men are overweight or obese (32%) than the level observed in NFHS-4 (24%). Nineteen percent of women in Telangana are too thin. Over half of women and men are at a healthy weight for their height.

Undernutrition is particularly common in the younger age groups (especially age 15-19), in rural areas for women, and among scheduled tribes. Overweight and obesity are most prevalent in older adults, those in urban areas, and well-educated men.

How many women are at a healthy weight for their height?

Percent distribution of women

For the first time, the 2019-21 NFHS measured the waist circumference and hip circumference of women and men age 15-49 years. This information was used to calculate the waist-to-hip ratio (WHR). WHR helps to identify the distribution of body fat and predicts abdominal obesity. Abdominal obesity is associated with an increased risk of type 2 diabetes mellitus, myocardial infarction, stroke, and premature death.

More than two-fifths (44%) of women and 46 percent of men have a waist-to-hip ratio (WHR) that puts them at a substantially increased risk of metabolic complications. The proportion of adults with an increased risk WHR increases with age, from 35 percent for women age 15-19 to 50 percent for women age 40-49, and from 20 percent for men age 15-19 to 60 percent for men age 40-49. The proportion of women having a substantially increased risk of WHR is higher in urban areas (48%) than in rural areas (42%) and the risk among men is also higher in urban areas (48%) than in rural areas (45%).

The use of iodized salt prevents iodine deficiency, which can lead to miscarriage, goitre, and mental retardation. Ninety-six percent of households with tested salt were using iodized salt at the time of the survey.

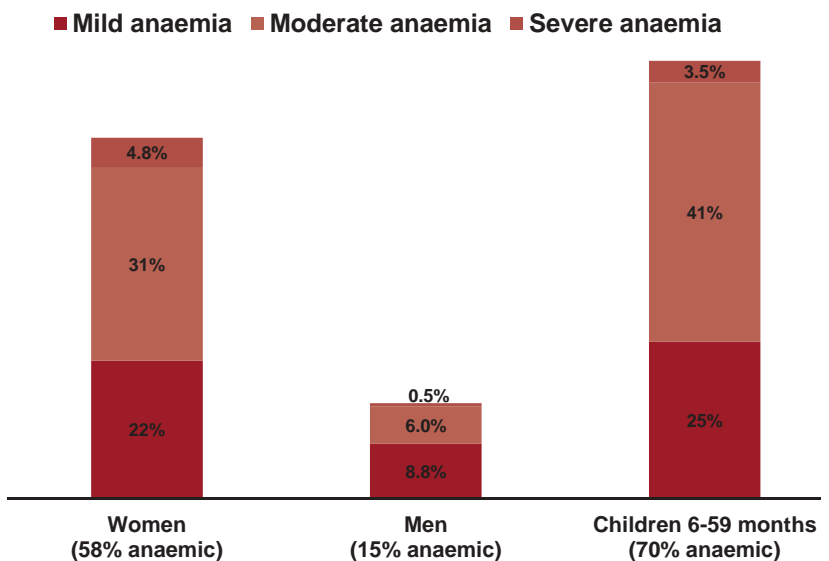

Anaemia

Anaemia is a condition that is marked by low levels of haemoglobin in the blood. Iron deficiency is estimated to be responsible for about half of all anaemia globally, but anaemia can also be caused by malaria, hookworms and other helminths, other nutritional deficiencies, chronic infections, and genetic conditions. Anaemia can result in maternal mortality, weakness, diminished physical and mental capacity, increased morbidity from infectious diseases, perinatal mortality, premature delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement. Anaemia is a major health problem in Telangana, especially among women and children.

More than two-thirds (70%) of children age 6-59 months are anaemic. This includes 25 percent who are mildly anaemic, 41 percent who are moderately anaemic, and 4 percent who have severe anaemia. The overall prevalence of anaemia in children increased from 61 percent in NFHS-4 to 70 percent in NFHS-5. There is no difference in the prevalence of anaemia among girls and boys in NFHS-5. Children of mothers who have anaemia are much more likely to be anaemic. Although anaemia levels vary somewhat according to background characteristics, anaemia among children is widespread in every group. Over two-thirds (67%) of children in Telangana are anaemic even if their mother has 12 or more years of schooling.

Fifty-eight percent of women in Telangana have anaemia, including 22 percent with mild anaemia, 31 percent with moderate anaemia, and 5 percent with severe anaemia. Anaemia is particularly high among rural women, women age 15-19, and scheduled tribe women, but anaemia exceeds 44 percent for every group of women. Anaemia among women has increased by 1 percentage points since NFHS-4. About 15 percent of men in Telangana are anaemic. Men age 15-19 and scheduled tribe men are particularly likely to be more anaemic.

Anaemia among women, men, and children

ADULT HEALTH AND HEALTH CARE

Tuberculosis

Tuberculosis is an infectious disease caused by a type of bacterium called Mycobacterium tuberculosis, which primarily affects the lungs. Tuberculosis is transmitted from person to person through the air, and people with lowered immunity, HIV, malnutrition, diabetes, and those who use tobacco or alcohol have higher chances of getting tuberculosis. Tuberculosis is both preventable and curable, however mortality is high if not treated properly. In Telangana, 234 persons per 100,000 are estimated to have medically treated tuberculosis, based on reports from household respondents. The prevalence of medically treated tuberculosis is lower among men (198) than among women (268) and is higher in rural areas (258) than in urban areas (193).

A large majority of respondents have heard of tuberculosis (85% of women and 79% of men), but even among those who have heard of tuberculosis, only 77 percent of women and 74 percent of men know that it is spread through the air by coughing or sneezing. About more than half (61%) of women and less than half (48%) of men have misconceptions about how tuberculosis is spread. Overall, 84 percent of women and 81 percent of men know that tuberculosis can be cured, and percent of men and women say that if a family member had tuberculosis, they would want to keep it a secret is same (46%).

Diabetes, asthma, goitre, heart disease, and cancer

According to self-reports, 2,373 women and 3,849 men age 15-49 per 100,000 have diabetes. Overall, 2,194 women and 1,070 men per 100,000 suffer from asthma. The prevalence of asthma among women and men is higher in older age groups, those who have less schooling, and those in rural areas. Goitre is more common than asthma or diabetes among women, but less common than asthma or diabetes among men (5,763 women and 799 men per 100,000). The prevalence of any heart disease is lower among women (886 per 100,000) than among men (1,784 per 100,000). Among the five diseases, cancer is the least common, with 120 women and 114 men per 100,000 reportedly having cancer.

Blood pressure (hypertension)

Blood pressure is the force exerted by circulating blood against the arterial walls. Hypertension or high blood pressure is a condition in which the blood vessels have persistently raised pressure. Hypertension is a major risk factor for cardiovascular diseases, chronic kidney diseases, and brain diseases, and it is a major cause of premature deaths worldwide. Some of the risk factors for developing hypertension are unhealthy diets, physical inactivity, alcohol and tobacco consumption, and excess body weight.

Fifteen percent of women age 15-49 in Telangana have hypertension, including 9 percent with Stage 1 hypertension and 2 percent each with Stage 2 and less than one percent with Stage 3 hypertension. Hypertension also includes women with normal blood pressure who are taking medicine to lower their blood pressure. Fifty-six percent of women have normal blood pressure.

The prevalence of hypertension among men age 15-49 is somewhat higher than among women. One-fourth of men in Telangana have hypertension, including 17 percent with Stage 1

hypertension, 5 percent with Stage 2 hypertension, and 1 percent with Stage 3 hypertension. Hypertension also includes men with normal blood pressure who are taking medicine to lower their blood pressure. Thirty-four percent of men have normal blood pressure. For both women and men, hypertension increases with age.

Blood glucose

Diabetes mellitus is a chronic metabolic disease characterized by elevated levels of blood glucose. Diabetes over a period of time can cause severe damage to the heart, blood vessels, retina, kidneys, and nerves, and it puts sufferers at increased risk of various infectious and non-infectious diseases. Early diagnosis, determined by blood glucose testing, and adequate treatment are the key steps for managing diabetes and its complications. NFHS-5 has included random blood glucose measurement using capillary blood among women and men age 15 and above.

In Telangana, four percent of women age 15-49 have high and very high blood glucose levels. In comparison, 6 percent of men age 15-49 have high and 7 percent have very high blood glucose levels. Women and men in older age groups and those with no schooling have relatively high blood glucose levels.

Women are more likely than men to have normal blood glucose levels and are taking medicine to lower their blood glucose level (2.5% of men versus 0.9% of women). More than one percent of both women (9%) and men (15%) have blood glucose levels ≥ 140 mg/dl and are taking medicine to lower their blood glucose level.

Screening tests for cancer

Cancer is a group of diseases with high mortality, and it is the second leading cause of death globally. The chances of successful treatment of cancer increase if diagnosed early. One way of early detection is screening, which is identification of unrecognized disease by using simple tests or examinations among those individuals who have the disease but do not yet have symptoms. NFHS-5 collected information about whether women had ever undergone a screening test for cancer of the oral cavity, breast, and cervix.

In Telangana, only 2 percent of women age 15-49 have ever undergone a screening test for cancer of the cervix, below one percent have ever undergone a screening test for breast cancer, and 2 percent have ever undergone a screening test for cancer of the oral cavity, which is slightly less than among men (2.4%).

Health insurance

Universal access to health care is the absence of any barriers in health care, including economic barriers. Adequate coverage by health insurance protects a person from financial hardships because of the costs of health care. Despite the emergence of a number of health insurance /financing schemes in India, 61 percent of households in Telangana have any kind of health insurance/financing scheme that covers at least one member of the household. Fifty-three percent health insurance/ financing scheme coverage in rural and 65 percent with urban areas. In Telangana, three types of programmes dominate: Central Government Health Scheme (CGHS), the State health insurance scheme, and the Employees' State Insurance Scheme (ESIS).

More than half (63%) of women and a little less than three-quarters (71%) percent of men age 15-49 in Telangana are covered by any health/financing scheme. Older women and men are more likely to be covered than younger women and men. Health insurance/financing scheme coverage is higher among women (75%) and men (74%) with no schooling than among those with 12 or more years of schooling women (54%) and men (72%), respectively.

Tobacco and alcohol use

One-fifth (20%) of men, but only 2 percent of women, age 15-49 use some form of tobacco. Tobacco products mostly used by men are cigarettes (11%), *bidis* (4%) *gutkha* or *paan masala* with tobacco (3%), *paan* with tobacco and *khaini* are same (3%). Among women and men, the use of any form of tobacco is slightly higher in rural areas (3% for women and 21% for men) than in urban areas (less than one percent (0.7%) for women and 19% for men). Most men who smoke cigarettes smoked fewer than five cigarettes in the past 24 hours.

In Telangana, among adults age 15-49, 5 percent of women and 50 percent of men drink alcohol, and the consumption is much higher in the rural areas. In rural areas, 7 percent of women and 56 percent of men drink alcohol. In urban areas, 2 percent of women and 42 percent of men drink alcohol. Most men who drink alcohol drink it about once a week (54%) or less than once a week (28%), and 19 percent drink almost every day.

HIV/AIDS

This section presents the findings from NFHS-5 on HIV/AIDS knowledge and attitudes, prior HIV testing, and the prevalence of sexually transmitted infections (STIs), as well as sexual behaviour of the adult and youth population. Questions on HIV/AIDS were included only in the subsample of households selected for the state module.

Awareness of HIV or AIDS

Ninety-three percent of women in Telangana have heard of HIV or AIDS. In urban areas, 97 percent know about HIV or AIDS, compared with 91 percent in rural areas. Women age 25-29 are more likely (96%) than older women age 40-49 (90%) to have heard of HIV or AIDS. Women with no schooling (85%), women with no regular exposure to media (87%), and scheduled tribe women (88%) are less likely than other women to have heard of HIV or AIDS.

Men are more likely than women to know about HIV or AIDS. Ninety-four percent of men in Telangana have heard of HIV or AIDS, including 97 percent in urban areas.

Knowledge of prevention and transmission

Men are much more likely than women to know how HIV/AIDS is transmitted and how to keep from getting it. For example, only 69 percent of women know that consistent condom use can help to prevent HIV/AIDS, compared with 75 percent of men, and 77 percent of women know that having just one uninfected partner who has no other partners can reduce the chance of getting HIV/AIDS, compared with 76 percent of men.

Less than one-third (31% each) of women and men have a 'comprehensive knowledge' about HIV/AIDS. This means they know that consistent use of condoms every time they have sex and having just one uninfected sex partner who has no other partners can reduce the chance of getting HIV/AIDS, they know that a healthy-looking person can have HIV/AIDS, and they reject two common misconceptions about the transmission or prevention of HIV/AIDS.

Do people know how to prevent HIV/AIDS?

Percentage of women and men age 15-49

HIV-related stigma

Sixty-two percent of women and 65 percent of men in Telangana would be willing to take care of a relative with HIV/AIDS in their home. A similar proportion of women (73%) and men (81%) say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching. Fifty-nine percent of women and 70 percent of men say that they would buy fresh vegetables from a shopkeeper with HIV/AIDS. Thirty-four percent of women and 29 percent of men say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret. Men (78%) are more likely than women (69%) to say that an HIV positive student should be allowed to attend school with students who are HIV negative. Nearly three-fifths of women (56%) and two-thirds of men (67%) think that people living with HIV/AIDS should be treated in the same public hospital as persons who are HIV negative. Almost four-fifths (79%) men and nearly three-quarters of women (73%) think that people living with HIV should be allowed to work in the same office with people who are HIV negative.

HIV testing prior to NFHS-5, blood transfusions, and safe injections

Only 38 percent of women and 13 percent of men age 15-49 had ever been tested for HIV prior to NFHS-5. Men in urban areas are somewhat more likely to have ever been tested for HIV prior to NFHS-5 than rural women and men. Fifty-five percent of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC. Urban women (52%) are slightly less likely than rural women (56%) to have been tested for HIV during ANC.

Fifty-five percent of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC.

In Telangana, 9 percent of women and 4 percent of men have ever had a blood transfusion. Women are more likely than men to have received an injection in the past 12 months (67% of women, compared with 60% of men). A disposable syringe was used for injections for three-quarters of adults who received an injection in the past 12 months.

SEXUAL BEHAVIOUR

NFHS-5 included questions on respondents' sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, higher-risk intercourse, and condom use. In addition, men were asked whether they had paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.

Higher-risk behaviour

Higher-risk sex is sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who had sex in the past 12 months, only 0.6 percent of women and 9 percent of men reported having had higher-risk sex during the past 12 months. The percentage of men who had higher-risk sexual intercourse in the past 12 months is somewhat higher (11%) in urban areas than in rural areas (7%). Even fewer respondents said that they had multiple sex partners in the past 12 months (0.2% of women and 4% of men).

One-thirds (33%) of men who had higher-risk sex in the past 12 months reported using a condom the last time they had higher-risk sex. Among men who had higher-risk sex in the past 12 months, the proportion who reported using a condom the last time they had higher-risk intercourse is lower in urban areas (31%) than in rural areas (36%). Two percent of men said they had paid for sex in the past year.

WOMEN'S EMPOWERMENT

Empowering women and promoting gender equality in every sphere of life are essential to improving their lives and achieving the Sustainable Development Goals. NFHS-5 has collected information related to women's empowerment and autonomy, including menstrual hygiene, employment and earnings, decision-making, ownership of assets, gender role attitudes, and domestic violence.

Women's hygiene

Using a hygienic method of menstrual protection is important for women's health and personal hygiene. In NFHS-5, young women age 15-24 were asked what method or methods they use for menstrual protection, if anything. In Telangana, 81 percent use sanitary napkins, 17 percent use cloth, 13 percent use locally prepared napkins, and 4 percent use tampons. Overall, 93 percent of women age 15-24 use a hygienic method of menstrual protection, up from 76 percent in NFHS-4. Notably, only 91 percent of rural women use a hygienic method of menstrual protection, compared with 97 percent of urban women.

Employment and earnings

Almost half (48%) of all women age 15-49, compared with 80 percent of men, were employed in the 12 months preceding the survey. Among employed women, 94 percent earned cash, including 2 percent who earned both cash and in-kind. Six percent were not paid at all. More men who were employed earned cash (94%), including 2 percent who earned both cash and in-kind. Five percent of employed men were not paid at all. A large majority (93%) of employed women work in non-agricultural occupations, compared with 64 percent of employed men.

Only 48 percent of all women age 15-49 were employed in the 12 months preceding the survey.

Among currently married women who work and are paid in cash, 75 percent decide how their earnings will be used, either alone or jointly with their husbands. Around two-fifths (39%) of women who work for cash and whose husbands earn in cash say that they earn more than or about the same as their husbands. Eighty-seven percent of currently married men who have wives who have cash earnings report that they alone or jointly with their wives decide how her earnings are used, and 44 percent men who have cash earnings and whose wives have cash earnings say that their wife earns more than or about the same as them.

Decision making

Currently married women were asked who makes decisions about their own health care, major household purchases, and visits to their own family or relatives. Women are more likely to participate in decisions about visits to their own family and relatives or about major household purchases (76% each) than decisions about their own health care (68%). Overall, 57 percent of currently married women participate in making all three of these decisions, and 13 percent do not participate in making any of the three decisions. Participation in all three decisions varies most by age, increasing sharply from 31 percent among women age 15-19 to 65 percent among women age 40-49.

In the case of currently married men, they are much more likely than women to report that they alone or jointly with their wives participated in making decisions about their own health care (85%) and 89 percent participated in decisions about major household purchases. Four percent of men did not participate in making either of these decisions.

Other indicators of women's empowerment

In Telangana, 32 percent of women have money that they can decide how to use. The proportion of women who have money that they can decide how to use is higher among urban (33%) than rural (31%) women, increases sharply with age, is much higher among women with below five years of schooling (43%), and is highest among women who are employed and employed for cash (43% each) than any other group of women.

Eighty-four percent of women have a bank or savings account that they themselves use.

Eighty-four percent of women have a bank or savings account that they themselves use. This percentage is highest, at 85 percent, among women who are Hindus, as well as among women who have below five years of schooling (91%). Women's knowledge and use of microcredit programmes is very limited. Sixty-two percent of women know of a microcredit programme in their area, but only 24 percent have ever taken a loan from a microcredit programme.

More than one-fifth (21%) of women who have a mobile phone use it for financial transactions. Urban women are more than twice (28%) as likely to use a mobile phone for financial transactions, than rural women (15%). This percentage increases with education with nearly two-fifths (39%) of women with 12 or more years of education using a mobile phone for financial transactions, compared with less than one-tenth of women having less than five years of schooling (10%) or no schooling (7%). Nearly one-fifth of employed women who earn cash and have a mobile phone use a mobile phone for financial transactions, compared with 6 percent of employed women who don't earn cash and have a mobile phone. Hindu women are least likely (19%) to use a mobile phone for financial transactions, compared with Muslim (30%) or Christian (24%) women.

Ownership of assets

Sixty-four percent of women and 74 percent of men age 15-49 in Telangana own a house alone or jointly with someone else, and 43 percent of women and 51 percent of men own land alone or jointly with someone else. Among men and women, ownership of a house and land is more common in rural than urban areas.

Sixty-four percent of women own a house alone or jointly with someone else, and 43 percent of women own land alone or jointly with someone else.

In Telangana, 60 percent of women have a mobile phone that they themselves use, and among women who have a mobile phone that they themselves use, 66 percent can read SMS messages. Three-quarters of urban women have a mobile phone they themselves use, compared with over half (51%) of rural women. Mobile phone access increases substantially with education, from 45% among women with no schooling to 81 percent among women with 12 or more years of schooling. Only 47 percent of scheduled tribe women have a mobile phone they themselves use, compared with 54-73 percent of women belonging to any other caste/tribe group. Scheduled tribe women who have a mobile phone that they themselves use are also less likely to be able to read SMS messages (51%) than women belonging to any other caste/tribe group (59-76%).

Three-fifths of women in Telangana have a mobile phone that they themselves use.

Gender-role attitudes

Eighty-four percent of women agree that a husband is justified in hitting or beating his wife under some circumstances. Women are most likely to agree that wife beating is justified if a woman shows disrespect for her in-laws (68%), followed by if she neglects the house or children (69%) and if he suspects her of being unfaithful (27%). Men are less likely to agree: 70 percent say that wife beating is justified in some circumstances, especially if the wife shows disrespect for in-laws or if she neglects the house or children (52% each) and if she argues with him (28%). Even among women and men who have completed at least 12 years of schooling, 80 percent of

women and 68 percent of men say that a husband is justified in hitting or beating his wife for one or more of the specified reasons.

Seventy-four percent of women and 50 percent of men believe that a woman is justified in refusing to have sex with her husband if she knows he has a sexually transmitted disease, if she knows he has intercourse with other women, and if she is tired or not in the mood. More than half of men (55%) agree that if a wife refuses to have sex with her husband he does not have a right to get angry and reprimand her, refuse to give her financial support, use force to have sex even if she doesn't want to, or have sex with another woman.

DOMESTIC VIOLENCE

The World Health Organization recognizes that violence against women, particularly domestic or spousal violence, is a major public and clinical health problem and a violation of women's human rights, which also reflects the scale of gender inequality and discrimination against women. The consequences of violence on physical, mental, sexual, and reproductive health often last a lifetime. NFHS-5 collected information on domestic violence from women age 18-49, related to behaviours of her husband that cause physical, sexual or emotional harm, including physical violence, sexual coercion, emotional abuse, and controlling behaviours. Information was also collected on violence during pregnancy and help seeking behaviour for any violence experienced.

In Telangana, 36 percent of ever-married women age 18-49 have ever experienced physical violence, and 5 percent have ever experienced sexual violence. In all, 38 percent of women experienced physical or sexual violence and 4 percent experienced both physical and sexual violence. For ever-married women who experienced physical violence since age 15, the most common perpetrator was the current husband.

Forty-one percent of ever-married women age 18-49 in Telangana have experienced physical or sexual violence.

Violence during pregnancy

Four percent of women age 18-49 who have ever been pregnant have ever experienced physical violence during one or more of their pregnancies. Women with no schooling, women with 3-4 children, and women who are widowed, divorced, separated, or deserted are more likely to experience violence during pregnancy than women in any other group.

Spousal violence

In Telangana, 36 percent of ever-married women age 18-49 have experienced any form of physical violence committed by their husband, 5 percent have experienced any form of sexual violence committed by their husband, and 19 percent have experienced any form of emotional violence committed by their husband. Thirty-one percent of ever-married women report having been slapped by their husband. Fifteen percent report being pushed, shaken, or having something thrown at them. Ten percent experienced having their arm twisted or hair pulled, 8

percent being punched with a fist or something that could hurt her, 15 percent report being kicked, dragged, or beaten up, and 2 percent that her husband tried to choke or burn her on purpose.

Four percent of ever-married women age 18-49 report that their husband have physically forced them to have sex even when they did not want to, and 2 percent report that their husband forced them with threats or in any other way to perform sexual acts they did not want to perform. Overall, 37 percent of ever-married women have experienced spousal physical or sexual violence from their current husband or, if not currently married, from their most recent husband. Few ever-married women (5%) reported that they have initiated violence against their husband when he was not already beating or physically hurting them.

Physical or sexual violence prevails across all groups. Although spousal violence is much lower among more educated women, around less than one-fourth (24%) women who have at least 12 years of schooling have experienced emotional, physical, or sexual spousal violence. The experience of spousal violence is higher among women in rural areas (46%) than in urban areas (29%); among divorced, separated, or deserted women (71%) than currently married women (38%); and among half (50%) of women who are employed for cash than women who are not employed (30%). Husband's characteristics are also related to overall spousal violence (emotional, physical, or sexual). For instance, women are more likely to experience spousal violence if their husband gets drunk often (73%), displays 5-6 marital control behaviours (72%), gets drunk sometimes (48%), and if the husband never attended school (53%). Three-quarters of women (75%) of women who say they are afraid of their husband most of the time have experienced spousal violence. The contextual and intergenerational aspects of spousal violence are clear from the fact that women whose mothers were beaten by their fathers are around twice as likely to be in abusive marriages themselves as compared with women whose mothers were not beaten by their fathers.

Is alcohol use related to spousal physical or sexual violence?

Percentage of ever-married women experiencing violence

Note: Category "Husband drinks, but never gets drunk", not shown since there are fewer than 25 unweighted cases.

Over one-fourth (28%) of ever-married women age 18-49 who have ever experienced physical or sexual violence reported suffering from injuries from what their husband did to them. That proportion more than doubles to 61 percent among ever-married women who have experienced both physical and sexual violence. The most common types of injuries among women who have experienced physical and sexual violence are cuts, bruises, or aches (56%); deep wounds, broken bones, broken teeth, or any other serious injury (16%); eye injuries, sprains, dislocations, or minor burns (23%); severe burns (22%).

Help seeking

Only 21 percent of women age 18-49 who have ever experienced physical or sexual violence sought help, while 8 percent never sought help but told someone. Less than three-quarters (71%) never sought help and never told anyone. Among women who sought help, the main sources of help were their own family (79%), their husband's family (18%), or a friend (9%). Only 8 percent sought help from the police.

na = Not applicable

¹ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals. The remaining households are non-nuclear households.

² Protected dug well, protected spring, rainwater, community RO plant, tanker truck, cart with small tank, bottled water

³ Defined as drinking water from an improved source, provided either water is on the premises or round-trip collection time is 30 minutes or less. Includes safely managed drinking water, which is not shown separately.

⁴ Drinking water from an improved source, provided round-trip collection time is more than 30 minutes or is unknown.

⁵ Total may add to more than 100.0 because households may use more than one method of treatment

⁶ Appropriate water treatment methods are boiling, adding bleach/chlorine tablets, filtering, electronic purifying, and solar disinfection

⁷ Includes ventilated improved pit (VIP) latrine/biogas latrine, and twin pit/composting toilet

⁸ Facilities that would be considered improved if they were not shared by two or more households

⁹ Defined as use of improved facilities that are not shared with other households.

¹⁰ Defined as use of improved facilities shared by two or more households.

¹¹ Houses made from mud, thatch, or other low-quality materials are called *kachha* houses, houses that use partly low-quality and partly high-quality materials are called semi-pucca houses, and houses made with high quality materials throughout, including the floor, roof, and exterior walls, are called *pucca* houses.

¹² Electricity, LPG/natural gas, biogas

¹³ Includes coal/lignite, charcoal, wood, straw/shrubs/grass, agricultural crop waste, and dung cakes

¹⁴ Frequency of smoking by anyone inside the house

Table 5 Access to a toilet facility

Percentage of households having access to a toilet facility by selected background characteristics, according to residence, Telangana, 2019-21

Background characteristic	Urban	Rural	Total
Religion of household head			
Hindu	97.2	82.8	87.3
Muslim	98.6	90.2	96.1
Christian	95.2	81.0	87.2

na = Not applicable

¹ Refers to women/men who can read a whole sentence or part of a sentence and women/men who completed standard 9 or higher (who are assumed to be literate)

Table 18 Fertility trends

Age-specific and total fertility rates and crude birth rates for the 3 years preceding the survey from NFHS-5 and NFHS-4, by residence, Telangana, 2019-21

Age	NFHS-5			NFHS-4		
	Urban	Rural	Total	Urban	Rural	Total
15-19	0.034	0.056	0.048	0.045	0.088	0.068
20-24	0.151	0.183	0.171	0.173	0.180	0.177
25-29	0.120	0.083	0.097	0.094	0.083	0.088
30-34	0.038	0.021	0.027	0.016	0.018	0.017
35-39	0.005	0.004	0.005	0.005	0.004	0.004
40-44	0.002	0.000	0.001	0.002	0.001	0.002
TFR (15-49)	1.75	1.74	1.75	1.67	1.88	1.79
CBR	16.0	14.9	15.3	17.1	17.2	17.1

Note: Rates are for the period 1-36 months preceding the survey (approximately 2013-15 for NFHS-4, and 2017-19 for NFHS-5). Age-specific fertility rates are expressed per 1,000 women.
TFR = Total fertility rate, expressed per woman
CBR = Crude birth rate, expressed per 1,000 population

Table 19 Fertility by background characteristics

Total fertility rate for the 3 years preceding the survey, percentage of women age 15-49 currently pregnant, mean number of children ever born to women age 40-49, and total wanted fertility by background characteristics, Telangana, 2019-21

Background characteristic	Total fertility rate	Percentage of women age 15-49 currently pregnant	Mean number of children ever born to women age 40-49	Total wanted fertility rate
Residence				
Urban	1.75	2.7	2.5	1.57
Rural	1.74	3.3	2.6	1.54
Schooling				
No schooling	2.08	0.8	2.7	1.75
<5 years complete	1.92	1.7	2.4	1.73
5-9 years complete	1.94	3.1	2.4	1.71
10-11 years complete	1.92	3.6	2.4	1.69

Number of users	13,917	436	162	93	175	14,819

Note: All information in this table is based on women's reports. All modern methods includes all users of modern contraceptive methods regardless of their marital status. Figures in parentheses are based on 25-49 unweighted cases. All modern method includes injectables and emergency contraception, which are not shown separately.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device; AYUSH = Ayurveda, yoga and naturopathy, unani, siddha and homeopathy; UHC = Urban health centre; UHP = Urban health post; UFWC = Urban family welfare centre; CHC = Community health centre; PHC = Primary health centre; ANM = Auxiliary nurse midwife; ICDS = Integrated Child Development Services; ASHA = Accredited Social Health Activist; NGO = Nongovernmental organization; TBA = Traditional birth attendant

¹ Excludes standard days method, lactational amenorrhoea method (LAM), and "other" modern methods

Table 32 Informed choice

Among women who are current users of selected modern contraceptive methods who started the last episode of use within the 5 years preceding the survey, percentage who were informed about possible side effects or problems of that method, percentage who were informed about what to do if they experienced side effects, percentage who were ever told by a health or family planning worker about other methods of family planning they could use, and percentage who were informed of all three (Method Information Index) by method, according to residence, Telangana, 2019-21

Method	Percentage who were informed about side effects or problems of method used	Percentage who were informed about what to do if experienced side effects	Percentage who were informed by a health or family planning worker of other methods that could be used	Percentage who were informed about all three (Method Information Index)	Number of women

Total	49.0	44.9	60.8	40.3	2,746

Note: Table includes only the contraceptive methods separately shown in the table and excludes users who obtained their method from friends/relatives or husband. Figures in the parentheses are based on 25-49 unweighted cases.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device

¹ Among women who were sterilized in the 5 years preceding the survey

Table 33 Twelve-month contraceptive discontinuation rates

Among women age 15-49 who started an episode of contraceptive use within the 5 years preceding the survey, percentage of episodes discontinued within 12 months, by reason for discontinuation and specific method, Telangana, 2019-21

Method	Reason for discontinuation								Switched to another method ⁴	Number of episodes of use ⁵
	Method failure	Desire to become pregnant	Other fertility related reason ¹	Side effects/ health concerns	Wanted more effective method	Other method related reason ²	Other reason	Any reason ³		
Pill	3.8	19.6	4.4	11.1	2.7	8.1	16.1	65.7	5.3	318
Condom/ <i>Nirodh</i>	4.4	25.0	4.7	2.9	0.9	9.7	15.0	62.6	6.0	387
Rhythm	(0.7)	(27.7)	(3.4)	(2.1)	(0.0)	(4.4)	(8.4)	(46.8)	(5.0)	202
Withdrawal	(3.7)	(22.1)	(0.9)	(0.9)	(0.0)	(3.5)	(27.2)	(58.4)	(7.3)	252
Other ⁶	3.3	39.0	9.1	4.3	3.4	3.7	14.8	77.7	8.5	297
All modern spacing methods ⁷	4.0	25.8	5.0	6.4	1.9	6.6	14.0	63.8	6.1	1,184
All spacing methods ⁸	3.5	25.5	4.5	5.0	1.4	5.8	15.3	61.0	6.2	1,644
All methods	1.2	9.0	1.6	1.8	0.5	2.1	5.5	21.8	2.2	4,507

Note: Figures are based on life table calculations using information on episodes of contraceptive use that occurred 3-62 months preceding the survey. All methods includes female and male sterilization, pill, injectable and other methods, which are not shown separately. Figures in parentheses are based on 25-49 unweighted cases.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device

¹ Includes infrequent sex/husband away, difficult to get pregnant/menopausal, and marital dissolution/separation

² Includes lack of access/too far, costs too much, and inconvenient to use

³ Reasons for discontinuation are mutually exclusive and add to the total given in this column

⁴ The episodes of use included in this column are a subset of the discontinued episodes included in the discontinuation rate. A woman is considered to have switched to another method if she used a different method in the month following discontinuation or if she gave "wanted a more effective method" as the reason for discontinuation and started another method within 2 months of discontinuation.

⁵ All episodes of use that occurred within the 5 years preceding the survey are included. Number of episodes of use includes both episodes of use that were discontinued during the period of observation and episodes of use that were not discontinued during the period of observation

⁶ Includes female condom, diaphragm, foam/jelly, standard days method, lactational amenorrhoea method (LAM), and other modern and traditional methods that are not shown separately

⁷ Includes pill, IUD/PPIUD, injectables, male condom, female condom, lactational amenorrhoea method (LAM), diaphragm, foam/jelly, and other modern spacing methods that are not shown separately

⁸ Includes pill, IUD/PPIUD, injectables, male condom, female condom, lactational amenorrhoea method (LAM), diaphragm, foam/jelly, rhythm, withdrawal, and other modern spacing and traditional methods that are not shown separately.

Table 34 Men's contraception-related perceptions and knowledge

Percentage of men age 15-49 who agree with two specific statements about women and contraception, and percent distribution of men according to their belief about the efficacy of condoms in preventing pregnancy, by background characteristics, Telangana, 2019-21

Background characteristic	Percentage of men who agree		Percentage of men who say that if a male condom is used correctly, it protects against pregnancy:				Total	Number of men
	Contraception is women's business and a man should not have to worry about it	Women who use contraception may become promiscuous	Most of the time	Sometimes	Not at all	Don't know/unsure ¹

Total	2.8	3.6	6.4	2.3	65.8	68.1	74.5	69.4	20,268	91.4	89.4

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA.

¹ Total demand is the sum of unmet need and met need

² Percentage of demand satisfied is met need divided by total demand

³ Modern methods include female sterilization, male sterilization, pill, IUD/PPIUD, injectables, male condom, female condom, standard days method, diaphragm, foam/jelly, lactational amenorrhoea method (LAM), and other modern methods

Table 36 Unmet need for family planning by district

Percentage of currently married women age 15-49 with unmet need for family planning by district, and total for NFHS-4, Telangana, 2019-21

District	Total unmet need	Unmet need for spacing	Unmet need for limiting	Number of women
Adilabad	10.1	4.7	5.4	446

Note: Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. Total includes information on births to women who don't know the number of antenatal care visits and women belonging to other religions, which is not shown separately.

na = Not applicable

¹ Health personnel includes doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, and other health personnel. If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this table.

² For the most recent birth in the 5 years preceding the survey

³ Postnatal checks are checks on the woman's health within 42 days of the birth

⁴ Includes nongovernmental organizations or trust hospitals/clinics

⁵ Includes missing

Table 53 Delivery and postnatal care by district

Percentage of live births in the 5 years preceding the survey delivered in a health facility, percentage delivered with assistance from health personnel, and percentage delivered by caesarean section, and percentage of women who had a live birth in the 5 years preceding the survey who received a postnatal check within two days of birth for their most recent birth, by district, Telangana, 2019-21

District	Percentage of births delivered in a public health facility	Percentage of births delivered in a private health facility	Percentage of births delivered in a health facility	Percentage of deliveries assisted by health personnel ¹	Percentage of births delivered by caesarean section	Number of births	Percentage of women with postnatal check within two days of birth ²	Number of women

³ Includes missing

Table 57 Trends in maternal care indicators

Maternal care indicators for births during the 5 years preceding the survey by residence, NFHS-5 and NFHS-4, Telangana, 2019-21

Indicator	NFHS-5 (2019-21)	NFHS-4 (2015-16)
URBAN		
Percentage who received antenatal care ¹	99.3	97.2
Percentage who had at least four antenatal care visits ¹	71.2	77.6
Percentage who received antenatal care within the first trimester of pregnancy ¹	89.9	87.4
Percentage of births delivered in a health facility ²	97.7	96.3
Percentage of deliveries assisted by health personnel ^{2,3}	94.5	94.7
RURAL		
Percentage who received antenatal care ¹	99.0	97.3
Percentage who had at least four antenatal care visits ¹	70.1	72.7
Percentage who received antenatal care within the first trimester of pregnancy ¹	87.6	79.2
Percentage of births delivered in a health facility ²	96.6	87.3
Percentage of deliveries assisted by health personnel ^{2,3}	92.9	88.4
TOTAL		
Percentage who received antenatal care ¹	99.2	97.2
Percentage who had at least four antenatal care visits ¹	70.5	75.0
Percentage who received antenatal care within the first trimester of pregnancy ¹	88.5	83.1
Percentage of births delivered in a health facility ²	97.0	91.5
Percentage of deliveries assisted by health personnel ^{2,3}	93.5	91.4

¹ Based on the last birth to women in the 5 years preceding the survey² Based on all births in the 5 years preceding the survey³ Doctor, auxiliary nurse midwife (ANM), nurse, midwife, lady health visitor (LHV), or other health personnel

Table 58 Male involvement in maternal care: Men's report

Among men age 15-49 whose youngest living child was age 0-35 months, percentage for whom the mother of the child received antenatal care (ANC), percentage who were present for at least one antenatal check-up, percentage who were told by a health provider or worker at any time during the pregnancy about specific signs of pregnancy complications, percentage to whom a health provider or worker spoke about specific aspects of maternal care at any time during the pregnancy, and percentage whose youngest child was delivered in a health facility, by residence, Telangana, 2019-21

Antenatal and delivery care information	Urban	Rural	Total
Percentage of men for whom the child's mother received antenatal care	84.6	99.2	93.2
Percentage of men who were present at any antenatal check-up	69.1	82.8	77.1
Percentage who were told by a health provider or worker about the following signs of pregnancy complications:			
Vaginal bleeding	37.0	46.1	42.4
Convulsions	43.4	54.9	50.2
Prolonged labour	45.2	58.3	52.9
Severe abdominal pain	70.7	61.2	65.1
High blood pressure	56.4	55.5	55.8
Percentage ever told what to do if the child's mother had any pregnancy complications	60.1	52.2	55.4
Percentage whose youngest child age 0-35 months was delivered in a health facility	86.0	96.8	92.4
Percentage to whom a health provider or worker spoke about the following aspects of maternal care:			
The importance of delivering the baby in a health facility	74.4	71.5	72.7
The importance of proper nutrition for the mother during pregnancy	80.2	78.3	79.1
Family planning or delaying his next child	57.0	54.1	55.3
Number of men with a youngest child age 0-35 months	184	265	449

Table 59 Vaccinations by background characteristics

Percentage of children age 12-23 months who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report), and percentage with a vaccination card seen by the interviewer, by background characteristics, Telangana, 2019-21, and total for NFHS-4

Background characteristic	Hepatitis B or Penta ¹			DPT or Penta ²			Polio ²			MCV/ Measles/ MMR/ MR	All basic vaccinations ³	All age appropriate vaccinations ⁴	No vaccinations	Percentage with a vaccination card seen	Number of children	
	BCG	0	1	2	3	0	1	2	3

Note: Table is based on children who stayed in the household the night before the interview. Each of the indices is expressed in standard deviation (SD) units from the median of the WHO Child Growth Standards. Table is based on children with valid dates of birth (month and year) and valid measurement of both height and weight. Figures in parentheses are based on 25-49 unweighted cases. Total includes children of birth order 6 or more, and children whose size at birth is not known, who are not shown separately.

BMI = Body mass index

¹ Recumbent length is measured for children under age 2; standing height is measured for all other children

² Includes children who are below -3 standard deviations (SD) from the WHO Child Growth Standards population median

³ Excludes children whose mothers were not interviewed

⁴ First-born twins (triplets, etc.) are counted as first births because they do not have a previous birth interval

⁵ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.

⁶ Excludes children whose mothers were not weighed and measured, children whose mothers were not interviewed, and children whose mothers are pregnant or gave birth within the preceding 2 months. Mother's nutritional status in terms of BMI (Body Mass Index) is presented in Table 78.

Table 68 Initial breastfeeding

Among last-born children who were born in the 2 years preceding the survey, percentage who were ever breastfed, and percentages who started breastfeeding within 1 hour and 1 day of birth, and among last-born children born in the 2 years preceding the survey who were ever breastfed, percentage who received a prelacteal feed in the first 3 days after birth, by background characteristics, Telangana, 2019-21

Background characteristic	Among last-born children born in the past 2 years:			Number of last-born children	Among last-born children born in the past 2 years who were ever breastfed:	
	Percentage ever breastfed	Percentage who started breastfeeding within 1 hour of birth	Percentage who started breastfeeding within 1 day of birth ¹		Percentage who received a prelacteal feed ²	Number of last-born ever breastfed children

Total	97.6	38.3	87.8	2,793	13.9	2,725

Note: Table is based on last-born children born in the 2 years preceding the survey regardless of whether the children are living or dead at the time of the interview. Figures in parentheses are based on 25-49 unweighted cases. Total includes women belonging to other religions, women whose delivery was assisted by *dai* (TBA), and women who delivered in an other place of delivery, who are not shown separately.

TBA = Traditional birth attendant

¹ Includes children who started breastfeeding within 1 hour of birth

² Children given something other than breast milk during the first 3 days of life

³ Doctor, nurse, midwife, auxiliary nurse midwife, lady health visitor, or other health personnel

Table 69 Breastfeeding status by age

Percent distribution of youngest children under age 2 years living with the mother by breastfeeding status and percentage currently breastfeeding, and percentage of all children under age 2 years using a bottle with a nipple, according to age in months, Telangana, 2019-21

Age in months	Not breastfeeding	Exclusively breastfed	Breastfeeding and consuming:				Total	Percentage currently breastfeeding	Number of youngest children under age 2 years living with the mother	Percentage using a bottle with a nipple	Number of all children under age 2 years
			Plain water only	Non-milk liquids ¹	Other milk	Complementary foods					
<2	4.8	74.6	3.2	0.7	5.3	11.3	100.0	221	10.9	226

9-11	3.9	11.1	7.1	1.9	4.5	71.4	100.0	411	21.2	418	
12-17	10.8	4.8	7.8	1.6	2.8	72.1	100.0	677	28.2	707	
18-23	24.9	3.4	3.8	0.7	4.6	62.6	100.0	609	26.1	700	
0-3	4.3	75.2	3.6	1.1	4.0	11.7	100.0	477	10.9	485	
0-5	4.2	68.2	6.4	0.9	5.0	15.3	100.0	710	10.2	720	
6-9	4.4	22.5	11.3	1.2	5.2	55.5	100.0	451	17.8	460	
12-15	9.8	4.9	8.8	1.7	2.8	72.0	100.0	476	25.8	489	
12-23	17.5	4.1	5.9	1.2	3.7	67.6	100.0	1,287	27.2	1,408	
20-23	28.1	2.6	3.2	0.6	3.3	62.3	100.0	396	26.3	464	

Note: Breastfeeding status refers to a "24-hour" period (yesterday during the day or at night). Children who are classified as breastfeeding and consuming plain water only consumed no liquid or solid supplements. The categories of not breastfeeding, exclusively breastfed, breastfeeding and consuming plain water, non-milk liquids, other milk, and complementary foods (solids and semi-solids) are hierarchical and mutually exclusive, and their percentages add to 100 percent. Thus, children who receive breast milk and non-milk liquids and who do not receive other milk and who do not receive complementary foods are classified in the non-milk liquid category even though they may also get plain water. Any children who get complementary food are classified in that category as long as they are breastfeeding as well.

¹ Non-milk liquids include juice, juice drinks, clear broth, and other liquids.

Table 70 Median duration of breastfeeding and infant and young child feeding (IYCF) practices

Median duration of any breastfeeding, exclusive breastfeeding, and predominant breastfeeding among last-born children born in the 3 years preceding the survey, by background characteristics, Telangana, 2019-21

Background characteristic	Median duration (months) of breastfeeding among last-born children born in the past 3 years ¹			Number of children
	Any breastfeeding	Exclusive breastfeeding	Predominant breastfeeding ²	
Sex				
Male	26.0	5.4	6.3	2,054
Female	27.6	5.2	6.6	1,806
Residence

Other backward class	26.6	5.3	6.1	2,262
Other	(25.8)	5.6	7.1	319
Total	26.8	5.3	6.4	3,859

Note: Median and mean durations are based on breastfeeding status of the child at the time of the survey (current status). Includes living and deceased children. Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. Total includes children belonging to Christian or other religions and children whose caste/tribe is not known, who are not shown separately.

¹ For last-born children under age 24 months who live with the mother and are breastfeeding, information to determine exclusive and predominant breastfeeding comes from a 24-hour dietary recall. Tabulations assume that last-born children age 24 months or older who live with the mother and are breastfeeding are neither exclusively nor predominantly breastfed. It is assumed that last-born children not currently living with the mother and all non-last-born children are not currently breastfeeding.

² Either exclusively breastfed or received breast milk and plain water, and/or non-milk liquids only

Table 71. Minimum acceptable diet

Percentage of youngest children age 6-23 months living with their mother who are fed a minimum acceptable diet based on breastfeeding status, number of food groups, and times they are fed during the day or night preceding the survey, according to background characteristics, Telangana, 2019-21

Table 71 Minimum acceptable diet—Continued

Percentage of youngest children age 6-23 months living with their mother who are fed a minimum acceptable diet based on breastfeeding status, number of food groups, and times they are fed during the day or night preceding the survey, according to background characteristics, Telangana, 2019-21

Background characteristic	Among breastfed children 6-23 months, percentage fed:			Among non-breastfed children 6-23 months, percentage fed:			Among all children 6-23 months, percentage fed:		
	Minimum dietary diversity ¹	Minimum meal frequency ²	Number of children breastfed diet ³	Minimum dietary diversity ¹	Minimum meal frequency ²	Number of children breastfed diet ³	Minimum dietary diversity ¹	Minimum meal frequency ²	Number of children breastfed diet ³
Caste/tribe									
Scheduled caste	42.9	24.6	8.0	442	(39.5)	(9.1)	(36.1)	(6.7)	43
Scheduled tribe	35.4	32.0	11.0	157	*	*	*	*	16
Other backward class	35.6	25.7	6.7	1,024	65.9	18.5	60.8	14.7	156
Other	44.9	34.5	17.9	133	(61.1)	(17.4)	(65.9)	(17.4)	41
Total	38.1	26.6	8.2	1,771	59.6	18.0	58.1	14.8	258

Note: Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. Total includes children belonging to other religions, and children whose caste/tribe is not known, who are not shown separately.

¹ Minimum dietary diversity is receiving foods from 5 or more of the following 8 food groups: Children received foods from four or more of the following food groups: a. breast milk b. infant formula, milk other than breast milk, cheese or yogurt or other milk products; c. foods made from grains or roots, including porridge or gruel, fortified baby food made from grains; d. vitamin A-rich fruits and vegetables; e. other fruits and vegetables; f. eggs; g. meat, poultry, fish, shellfish, or organ meats; h. beans, peas, lentils, or nuts

² For breastfed children, minimum meal frequency is receiving solid or semi-solid food at least twice a day for infants 6-8 months and at least three times a day for children 9-23 months

³ Breastfed children age 6-23 months are considered to be fed a minimum acceptable diet if they are fed the minimum dietary diversity as described in footnote 1 and the minimum meal frequency as described in footnote 2

⁴ Includes two or more feedings of commercial infant formula; fresh, tinned and powdered animal milk; and yogurt

⁵ For non-breastfed children age 6-23 months, minimum meal frequency is receiving solid or semi-solid food or milk feeds at least four times a day. At least one of the feeds must be a solid or semi-solid food.

⁶ Non-breastfed children age 6-23 months are considered to be fed a minimum acceptable diet if they receive other milk or milk products at least twice a day, receive the minimum meal frequency as described in footnote 5, and receive solid or semi-solid foods from at least four food groups not including the milk or milk products food group

⁷ Breastfeeding, or not breastfeeding and receiving two or more feedings of commercial infant formula, fresh, tinned, and powdered animal milk, and yogurt

⁸ Children are fed the minimum recommended number of times per day according to their age and breastfeeding status as described in footnotes 2 and 5

⁹ Children age 6-23 months are considered to be fed a minimum acceptable diet if they receive breast milk, other milk or milk products as described in footnote 7, are fed the minimum dietary diversity as described in footnote 1, and are fed the minimum meal frequency as described in footnotes 2 and 5.

Table 73 Prevalence of anaemia in children

Table 73 Prevalence of anaemia in children—*Continued*

Percentage of children age 6-59 months classified as having anaemia, by background characteristics, Telangana, 2019-21 and total for NFHS-4

Background characteristic	Anaemia status by haemoglobin level			Any anaemia (<11.0 g/dl)	Number of children
	Mild (10.0-10.9 g/dl)	Moderate (7.0-9.9 g/dl)	Severe (<7.0 g/dl)		
Child's living arrangements					
Living with both parents	25.3	40.5	3.7	69.5	4,463
Living with one or neither parent	23.5	48.0	2.3	73.8	570
Mother's anaemia status³					
Not anaemic	26.5	36.6	2.8	65.8	2,164
Mildly anaemic	23.6	42.5	3.9	70.0	1,142
Moderately/severely anaemic	24.4	46.6	4.3	75.2	1,670
Total	25.1	41.4	3.5	70.0	5,033
NFHS-4 (2015-16)	24.7	33.5	2.5	60.7	1,795

Note: Table is based on children who stayed in the household the night before the interview and who were tested for anaemia. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formula (Centre for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. *Morbidity and Mortality Weekly Report* 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). Figures in parentheses are based on 25-49 unweighted cases. Total includes children of birth order 6 or more, who are not shown separately.

¹ Excludes children whose mothers were not interviewed

² For mothers who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.

³ Mildly anaemic is 11.0-11.9 g/dl for non-pregnant women and 10.0-10.9 g/dl for pregnant women. Moderately/severely anaemic is <11.0 g/dl for non-pregnant women and <10.0 g/dl for pregnant women. Adjusted for altitude and for smoking status. Excludes children whose mother's anaemia status is not known.

Table 74 Micronutrient intake among children

Percentage of youngest children age 6-23 months living with their mother who consumed vitamin A-rich and iron-rich foods in the day or night preceding the survey, percentage of children age 6-23 months who were given multiple micronutrient powder in the last 7 days, who were given iron supplements in the last 7 days, and who were given deworming medication in the last 6 months; percentage of children age 9-35 months who were given vitamin A supplements in the 6 months preceding the survey; and percentage of children age 6-59 months who live in households using iodized salt, by background characteristics, Telangana, 2019-21

Table 74 Micronutrient intake among children—Continued

Percentage of youngest children age 6-23 months living with the mother who consumed vitamin A-rich and iron-rich foods in the day or night preceding the survey, percentage of children age 6-23 months who were given multiple micronutrient powder in the last 7 days, who were given iron supplements in the last 7 days, and who were given deworming medication in the last 6 months; percentage of children age 9-35 months who were given vitamin A supplements in the 6 months preceding the survey, and percentage of children age 6-59 months who live in households using iodized salt, by background characteristics, Telangana, 2019-21

Background characteristic	Among youngest children age 6-23 months living with their mother:				Among children age 6-23 months:				Among children age 9-35 months:		Among children age 6-59 months in households with salt tested:	
	Percentage who consumed foods rich in vitamin A in last 24 hours ¹	Percentage who consumed foods rich in iron in last 24 hours ²	Number of children	Percentage given multiple micronutrient powder in last 7 days ³	Percentage given iron supplements in last 7 days ³	Percentage given deworming medication in last 6 months ^{3,4}	Number of children	Percentage given vitamin A supplements in the last 6 months ⁵	Number of children	Percentage using iodized salt ⁶	Number of children	Percentage living in households using iodized salt ⁶
Caste/tribe

Total	43.4	34.1	2,029	10.5	41.7	33.5	2,166	72.4	3,288	96.0	6,290	

Note: Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. Total includes children of birth order 6 or more, who are not shown separately.

na = Not applicable

nc = No cases

¹ Includes meat and organ meats, fish, poultry, eggs, pumpkin, carrots, squash, sweet potatoes that are yellow or orange inside, dark green leafy vegetables, ripe mango, papaya, cantaloupe, and jackfruit

² Includes meat and organ meats, fish, poultry, and eggs

³ Based on mother's recall

⁴ Deworming for intestinal parasites is commonly done for helminths and schistosomiasis

⁵ Based on mother's recall and the vaccination card (where available)

⁶ Excludes children in households in which salt was not tested. Includes children whose mothers were not interviewed except for birth order.

⁷ Excludes children whose breastfeeding status is unknown

Table 75 Presence of iodized salt in household

Percent distribution of households by salt testing, and among households with salt tested, percentage with iodized salt, according to background characteristics, Telangana, 2019-21, and total for NFHS-4

Note: Figures in parentheses are based on 25-49 unweighted cases.

SBP = Systolic blood pressure; DBP = Diastolic blood pressure

¹ A woman is classified as having hypertension if she has SBP ≥140 mmHg or DBP ≥90 mmHg at the time of the survey, or she is currently taking antihypertensive medication to control blood pressure. The term hypertension as used in this table is not meant to be a clinical diagnosis of the disease, but rather to provide an indication of the disease burden in the population at the time of the survey.

Table 92.2 Blood pressure status: Men

Among men age 15-49, prevalence of hypertension, percent distribution of blood pressure values, and percentage having normal blood pressure and taking medication to lower blood pressure, by background characteristics, Telangana, 2019-21

Background characteristic	Prevalence of hypertension ¹	Normal			Pre-hypertensive			Hypertensive			Total	Percentage with normal blood pressure and taking medicine	Number of men

Table 92.2 Blood pressure status: Men—Continued

Among men age 15-49, prevalence of hypertension, percent distribution of blood pressure values, and percentage having normal blood pressure and taking medication to lower blood pressure, by background characteristics, Telangana, 2019-21

Background characteristic	Prevalence of hypertension ¹	Normal			Pre-hypertensive			Hypertensive			Total	Percentage with normal blood pressure and taking medicine	Number of men
		SBP <120 mmHg and DBP <80 mmHg	SBP 120-139 mmHg or DBP 80-89 mmHg	Stage 1: SBP 140-159 mmHg or DBP 90-99 mmHg	Stage 2: SBP 160-179 mmHg or DBP 100-109 mmHg	Stage 3: SBP ≥180 mmHg or DBP ≥110 mmHg							
Caste/tribe													
Scheduled caste	25.6	37.0	38.6	18.0	5.3	1.1	100.0	0.4	730				
Scheduled tribe	17.0	34.4	49.0	13.0	1.7	1.9	100.0	0.2	229				
Other backward class	26.0	33.9	42.7	17.8	4.5	1.1	100.0	0.6	1,785				
Other	23.3	28.3	51.4	14.6	5.1	0.5	100.0	1.1	250				
Total age 15-49	25.0	34.3	42.8	17.2	4.5	1.1	100.0	0.6	3,000				
Age 50-54	45.7	21.9	42.7	26.2	6.9	2.3	100.0	5.4	316				
Total age 15-54	26.9	33.1	42.8	18.0	4.8	1.2	100.0	1.0	3,315				

Note: Total includes men belonging to other religions and men who don't know their caste/tribe, who are not shown separately.

SBP = Systolic blood pressure; DBP = Diastolic blood pressure

¹ A man is classified as having hypertension if he has SBP ≥140 mmHg or DBP ≥90 mmHg at time of survey, or he is currently taking antihypertensive medication to control blood pressure. The term hypertension as used in this table is not meant to be a clinical diagnosis of the disease, but rather to provide an indication of the disease burden in the population at the time of the survey.

Table 93.1 Random blood glucose levels: Women

Among women age 15-49, percent distribution of random blood glucose values, by background characteristics, Telangana, 2019-21

Background characteristic	Random blood glucose values			Total	Percentage with normal blood glucose levels and taking medicine to lower their blood glucose level	Percentage with >140 mg/dl blood glucose levels or taking medicine to lower their blood glucose level	Number of women

Total age 15-54	na	na	na	na	na	na	75.6	51.6	3,863

Note: Figures in the parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. Total includes women/men belonging to other religions, who are not shown separately.

na = Not applicable

¹ Nuclear household are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted or fostered) with or without unrelated individuals. The remaining households are non-nuclear households.

Table 102 Gender role attitudes

Percentage of women and men age 15-49 with specific attitudes toward wife beating and refusal by a wife to have sex with her husband by reason, and percentage of men age 15-49 who agree that a man can behave in specific ways if his wife refuses to have sex with him, according to marital status, Telangana, 2019-21

Reason/behaviour	Ever-married		Never married		Total	
	Women	Men	Women	Men	Women	Men
Percentage who agree that a husband is justified in hitting or beating his wife if:						
She goes out without telling him	31.8	26.4	28.1	26.8	31.2	26.6
She neglects the house or children	70.1	52.0	63.8	50.8	69.0	51.5
She argues with him	30.5	29.7	23.5	25.0	29.3	27.9
She refuses to have sexual intercourse with him	17.7	16.2	13.3	16.0	16.9	16.1
She doesn't cook properly	15.0	13.4	14.7	11.9	15.0	12.9
He suspects her of being unfaithful	28.0	30.8	21.3	27.5	26.8	29.6
She shows disrespect for in-laws	68.7	50.5	62.4	53.9	67.6	51.8
Percentage who agree with at least one specified reason	84.9	69.5	78.9	72.0	83.8	70.4
Percentage who agree that a wife is justified in refusing to have sex with her husband when she:						
Knows her husband has a sexually transmitted disease	88.8	74.1	75.8	68.6	86.5	72.0
Knows her husband has sex with other women	84.7	69.5	73.4	65.1	82.7	67.8
Is tired or not in the mood	85.0	64.4	71.9	59.3	82.7	62.4
Percentage who agree with all three reasons	76.5	51.0	61.1	48.6	73.8	50.1
Percentage who agree with none of the three reasons	6.5	14.7	16.5	20.9	8.3	17.0
Percentage who agree that when a wife refuses to have sex with her husband, he has the right to:						
Get angry and reprimand her	na	28.7	na	23.1	na	26.6
Refuse to give her financial support	na	16.5	na	14.5	na	15.7
Use force to have sex even if she doesn't want to	na	18.7	na	16.0	na	17.7
Have sex with another woman	na	19.5	na	17.0	na	18.6
Percentage who agree with all four behaviours	na	6.7	na	5.4	na	6.2
Percentage who agree with none of the four behaviours	na	56.2	na	61.6	na	58.2
Number of respondents	3,370	2,195	730	1,329	4,100	3,524
na = Not applicable

Table 108 Spousal violence by husband's characteristics and empowerment indicators—*Continued*

Percentage of ever-married women age 18-49 who have ever suffered emotional, physical, or sexual violence committed by their husband, according to his characteristics, marital characteristics, and selected empowerment indicators, Telangana, 2019-21

Background characteristic	Emotional violence	Physical violence	Sexual violence	Physical or sexual violence	Emotional, physical, or sexual violence	Number of women
Number of reasons given for refusing to have sexual intercourse with husband⁵						
0	9.9	31.4	4.2	32.0	32.9	165
1-2	21.6	35.3	5.1	36.7	42.3	470
3	18.6	37.1	4.4	37.4	40.3	2,009
Afraid of husband						
Most of the time	52.9	69.1	17.5	70.1	74.5	341
Sometimes	14.9	34.7	2.9	35.2	38.2	1,923
Never	6.4	15.8	1.0	15.8	19.6	379
Total	18.6	36.4	4.5	36.9	40.2	2,644

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women. Figures in parentheses are based on 25-49 unweighted cases. Total includes women whose husband drinks alcohol but never gets drunk and women who are older than their husband, who are not shown separately.

¹ Currently married women only

² Behaviours include: Is jealous or angry if she talks to other men, frequently accuses her of being unfaithful, does not permit her to meet her female friends, tries to limit her contact with her family, insists on knowing where she is at all times, and does not trust her with any money

³ Currently married women only. Decisions included are decisions about own health care, major household purchases, and visits to her family or relatives.

⁴ Reasons given for which wife beating is justified include: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn't cook properly, he suspects she is unfaithful, and she shows disrespect for in-laws

⁵ Reasons given for refusing to have sexual intercourse with husband include: she knows her husband has a sexually transmitted disease, she knows her husband has sex with other women, and she is tired or not in the mood

Table 109 Injuries to women due to spousal violence

Percentage of ever-married women age 18-49 who have experienced spousal violence by types of injuries resulting from what their husband did to them, the type of violence, and whether they have experienced the violence ever and in the 12 months preceding the survey, Telangana, 2019-21

Type of spousal violence experienced	Percentage of women who have had:					Number of ever-married women
	Cuts, bruises, or aches	Severe burns	Eye injuries, sprains, dislocations, or minor burns	Deep wounds, broken bones, broken teeth, or any other serious injury	Any of these injuries	
Experienced physical violence						
Ever ¹	24.1	6.0	7.8	4.5	28.6	964
In the past 12 months	23.3	6.5	7.4	4.8	27.5	754
Experienced sexual violence						
Ever ¹	51.1	19.2	20.8	14.2	55.3	119
In the past 12 months	47.8	19.2	16.8	12.9	51.9	94
Experienced physical or sexual violence						
Ever ¹	23.8	5.9	7.7	4.4	28.3	976
In the past 12 months	23.0	6.4	7.3	4.7	27.2	765
Experienced physical and sexual violence						
Ever ¹	56.2	21.5	23.2	15.8	60.9	106
In the past 12 months	53.9	21.9	19.1	14.2	58.6	83

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.

¹ Includes violence in the past 12 months

Table 110 Help seeking

Percentage of women age 18-49 who have ever experienced physical or sexual violence by whether they have ever sought help, and among those who have sought help from any source, the source from which help was sought, according to the type of violence experienced and marital status, Telangana, 2019-21

Help seeking/source of help	Type of violence experienced			Marital status		Total
	Physical only	Sexual only	Both physical and sexual	Ever-married	Never married	
Help seeking						
Never sought help and never told anyone	73.0	*	52.9	70.9	(71.6)	71.0
Never sought help but told someone	8.2	*	7.2	7.7	(15.9)	8.0
Sought help	18.8	*	39.9	21.4	(12.5)	21.0
Don't know/missing	0.0	*	0.0	0.0	(0.0)	0.0
Number of women who experienced violence	994	12	121	1,081	47	1,127
Sources of help among those who sought any help¹						
Own family	78.8	*	80.0	78.9	*	79.2
Husband's family	19.3	*	11.2	17.9	*	17.5
Current/former husband	1.5	*	0.0	1.2	*	1.2
Friend	6.2	*	21.0	8.0	*	9.2
Neighbour	10.3	*	12.9	10.8	*	10.7
Religious leader	1.2	*	1.3	1.2	*	1.2
Doctor/medical personnel	0.0	*	2.6	0.5	*	0.5
Police	6.1	*	15.1	8.1	*	7.9
Lawyer	0.5	*	2.9	1.0	*	1.0
Social service organization	0.6	*	3.8	1.3	*	1.3
Other	0.8	*	0.0	0.7	*	0.6
Number of women who experienced violence and sought help	186	2	48	231	6	237

Note: Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

¹ Women can report more than one source from which they sought help.

APPENDIX

ESTIMATES OF SAMPLING ERRORS

The estimates from a sample survey are affected by two types of errors: (1) non-sampling errors, and (2) sampling errors. Non-sampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the fifth National Family Health Survey (NFHS-5) to minimize this type of error, non-sampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-5 is only one of many samples that could have been selected from the same population, using the same design and expected sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the standard error for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS-5 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-5 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jack knife repeated replication method is used for variance estimation of more complex statistics such as total fertility rates and child mortality rates.

The Taylor linearization method treats any proportion or mean as a ratio estimate, $r = y/x$, where y represents the total sample value for variable y , and x represents the total number of cases in the group or subgroup under consideration. The variance of r is computed using the formula given below, with the standard error being the square root of the variance:

$$SE^2(r) = var(r) = \frac{1-f}{x^2} \sum_{h=1}^H \left[\frac{m_h}{m_h - 1} \left(\sum_{i=1}^{m_h} z_{hi}^2 - \frac{z_h^2}{m_h} \right) \right]$$

in which

$$z_{hi} = y_{hi} - rx_{hi}, \text{ and } z_h = y_h - rx_h$$

- where h represents the stratum, which varies from 1 to H ,
 m_h is the total number of clusters selected in the h^{th} stratum,
 y_{hi} is the sum of the weighted values of variable y in the i^{th} cluster in the h^{th} stratum,
 x_{hi} is the sum of the weighted number of cases in the i^{th} cluster in the h^{th} stratum, and
 f is the overall sampling fraction, which is so small that it is ignored.

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers all but one cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the NFHS-5 sample for Telangana, there were 1302 clusters. Hence, 1302 replications were created. The variance of a rate r is calculated as follows:

$$SE^2(r) = var(r) = \frac{1}{k(k-1)} \sum_{i=1}^k (r_i - r)^2$$

in which

$$r_i = kr - (k-1)r_{(i)}$$

- where r is the estimate computed from the full sample of 1302 clusters,
 $r_{(i)}$ is the estimate computed from the reduced sample of 1301 clusters (i^{th} cluster excluded), and
 k is the total number of clusters.

In addition to the standard error, the design effect (DEFT) for each estimate is computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. The relative standard error (SE/R) and confidence limits ($R \pm 2SE$) for each estimate are also computed.

Sampling errors for NFHS-5 are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for Telangana as a whole and for the urban and rural areas of the state. For each variable, the type of statistic (mean, proportion, rate, or ratio) and the base population are given in Table A.1. Tables A.2-A.4 present the total, urban, and rural values of the statistic (R), their standard errors (SE), the number of unweighted (N) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits ($R \pm 2SE$) for each variable. The DEFT is considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1).

Table A.1 List of variables for sampling errors, Telangana, 2019-21

Variable	Estimate	Base population
HOUSEHOLDS		
Using an improved source of drinking water	Proportion	Households
Using an improved sanitation facility	Proportion	Households
Using iodized salt	Proportion	Households
Sex ratio (females per 1,000 males)	Ratio	<i>De facto</i> household population, all ages
WOMEN		
No schooling (Females age 6 years and above)	Proportion	<i>De facto</i> household population of females age 6 and above
Urban residence	Proportion	Women age 15-49
No schooling (Women age 15-49)	Proportion	Women age 15-49
Completed 10 or more years of schooling	Proportion	Women age 15-49
Never married, including married <i>gauna</i> not performed	Proportion	Women age 15-49
Currently married	Proportion	Women age 15-49
Married before age 18	Proportion	Women age 20-49
Currently using any contraceptive method	Proportion	Currently married women age 15-49
Currently using a modern contraceptive method	Proportion	Currently married women age 15-49
Currently using a traditional contraceptive method	Proportion	Currently married women age 15-49
Currently using pill	Proportion	Currently married women age 15-49
Currently using IUD/PPIUD	Proportion	Currently married women age 15-49
Currently using condom/ <i>Nirodh</i>	Proportion	Currently married women age 15-49
Currently using female sterilization	Proportion	Currently married women age 15-49
Using public health sector source of contraception	Proportion	Women age 15-49 currently using modern methods of contraception
Unmet need for family planning	Proportion	Currently married women age 15-49
Want no more children	Proportion	Currently married women age 15-49
Want to delay next birth at least 2 years	Proportion	Currently married women age 15-49
Mother received four or more antenatal care (ANC) visits	Proportion	Women with at least one birth in last five years (last birth)
Took iron and folic acid (IFA) for 100 days or more	Proportion	Women with at least one birth in last five years (last birth)
Birth registration	Proportion	<i>De jure</i> children under age 5 years
Births delivered by a skilled provider	Proportion	Births in last 5 years
Institutional delivery	Proportion	Births in last 5 years
Postnatal check for mother within 2 days of birth	Proportion	Women with at least one birth in last five years (last birth)
Postnatal check for newborn within 2 days of birth	Proportion	Women with at least one birth in last five years (last birth)
Exclusive breastfeeding	Proportion	Children under age 6 months
Children with diarrhoea in the last two weeks	Proportion	Children under age 5 years
Treated with oral rehydration salt (ORS) packets	Proportion	Children under age 5 years with diarrhoea in last 2 weeks
Children with diarrhoea taken to a health provider	Proportion	Children under age 5 years with diarrhoea in last 2 weeks
Child received BCG vaccination	Proportion	Children age 12-23 months
Child received penta or DPT vaccination (3 doses)	Proportion	Children age 12-23 months
Child received polio vaccination (3 doses)	Proportion	Children age 12-23 months
Child received first dose of measles vaccine	Proportion	Children age 12-23 months
Child received penta or hepatitis B vaccination (3 doses)	Proportion	Children age 12-23 months
Child with all basic vaccinations	Proportion	Children age 12-23 months
Height-for-age, stunting (below -2SD)	Proportion	Children under age 5 years who were measured
Weight-for-height, wasting (below -2SD)	Proportion	Children under age 5 years who were measured
Weight-for-age, underweight (below -2SD)	Proportion	Children under age 5 years who were measured
Children with any anaemia	Proportion	Children age 6-59 months with an anaemia test
Women with any anaemia	Proportion	Women age 15-49 with an anaemia test
Body mass index (BMI) <18.5 kg/m ²	Proportion	Women age 15-49 who were measured
Body mass index (BMI) ≥25.0 kg/m ²	Proportion	Women age 15-49 who were measured
Waist-to-hip ratio ≥0.85	Proportion	Women age 15-49 who were measured
Have heard of HIV or AIDS	Proportion	Women age 15-49
Have comprehensive knowledge about HIV/AIDS	Proportion	Women age 15-49
Ever experienced physical or sexual violence	Proportion	Women age 15-49
Total fertility rate (last 3 years)	Rate	Women
Neonatal mortality	Rate	Births in last 5 years
Postneonatal mortality	Rate	Births in last 5 years
Infant mortality	Rate	Births in last 5 years
Child mortality	Rate	Births in last 5 years
Under-five mortality	Rate	Births in last 5 years
MEN		
No schooling (Males age 6 years and above)	Proportion	<i>De facto</i> household population of males age 6 and above
Urban residence	Proportion	Men age 15-49
No schooling (Men age 15-49)	Proportion	Men age 15-49
Completed 10 or more years of schooling	Proportion	Men age 15-49
Never married, including married <i>gauna</i> not performed	Proportion	Men age 15-49
Currently married	Proportion	Men age 15-49
Married before age 21	Proportion	Men age 25-49
Want no more children	Proportion	Currently married men age 15-49
Want to delay next birth at least 2 years	Proportion	Currently married men age 15-49
Men with any anaemia	Proportion	Men age 15-49 with an anaemia test
Body mass index (BMI) <18.5 kg/m ²	Proportion	Men age 15-49 who were measured
Body mass index (BMI) ≥25.0 kg/m ²	Proportion	Men age 15-49 who were measured
Waist-to-hip ratio ≥0.90	Proportion	Men age 15-49 who were measured
Have heard of HIV or AIDS	Proportion	Men age 15-49
Have comprehensive knowledge about HIV/AIDS	Proportion	Men age 15-49

Table A.2 Sampling errors: Total sample, Telangana, 2019-21

Variable	Value (R)	Standard error (SE)	Number of cases		Design effect (DEFT)	Relative standard error (SE/R)	Confidence limits	
			Unweighted (N)	Weighted (WN)			R-2SE	R+2SE
HOUSEHOLDS
